Since professional education must continue for five years at least (a period exceeded by the vast majority), and since the cost of living varies much in different parts of the country, while personal expenditure varies still more, it can only be said in a general way that anyone who thinks of entering the profession should be prepared for an outlay of at least £1,500. Something between two-thirds and three-quarters of the whole amount would probably be spent on maintenance, and the rest in fees, etc., for tuition and examination. The fees charged by the different schools and licensing bodies are stated in the paragraphs relating to each on other pages of this issue. When making an estimate of the probable outlay, the many helps available nowadays for the reduction of expense should not be ignored. At nearly all the medical schools more scholarships and money prizes are offered now than in the past; at the Scottish universities bursaries are numerous; and the Carnegie Trust (whose regulations are summarized at page 432) gives pecuniary help to many Scottish students. The main thing to bear in mind when considering costs is that, as compared with other professions, the period of training in medicine is long, and for most students expensive. Further guidance on this matter will be found in a memorandum,[1] drawn up by the Registrar of the General Medical Council, on the procedure to be followed in order to enter the profession. This pamphlet gives much useful information, including a comparative table of the cost of study and examination at the various institutions.

Since medical students are not commonly the sons or daughters of wealthy parents, it is usual, before setting out upon this long and exacting course of study, to weigh, not only the cost, but also the prospects. The youth and the girl of to-day, when reckoning up their chances in any calling, will wish to know the probable numbers of their competitors for the work that is waiting to be done.

NUMBERS OF MEDICAL STUDENTS

The following brief survey should be read with the notes and tables printed at page 418 on the numbers of registered students and practitioners. More new students mean more new doctors five or six years later, though, as the chart shows, there is in normal times a fairly constant wastage.

At the close of the last century the annual entry of medical students in the United Kingdom had been on the average about 1,800, and then for the next thirteen

[1] *Memorandum on the Procedure to be Adopted by those who desire to enter the Profession of Medicine, with Notes on Costs and Prospects.* General Medical Council, 44, Hallam Street, Portland Place, W.1. Price 1s. post free.

years it stood at about 1,400. During the war period, though many students left to serve with the Forces, the entries grew steadily larger, so that in 1918 they were 2,253, and in the following year, when demobilization was in active progress, they were 3,420. In the next five years the numbers rapidly fell, but from 1923 to 1928 they remained at a fairly steady level rather below the immediate pre-war average. In 1924 the entries were 1,043; in 1925, 1,070; in 1926, 1,260; in 1927, 1,214; and in 1928, 1,362. In 1929 they rose again to 1,502, and last year to 1,792.

The excessive entries during the post-war inflation period, if they had gone on long enough, must have led to overstocking of the profession. In the past decade the numbers of new practitioners registering each year have greatly exceeded the usual pre-war figure of eleven hundred or so. The large additions to the profession in recent years brought the total number of names in the *Medical Register* up to 55,291 at the end of 1930. This is upwards of ten thousand more than the figure for 1920, nearly fifteen thousand more than that for 1910, and nineteen thousand more than that for 1900. The population of the British Isles has not increased at anything like that rate during the same decennial periods, and the ratio of doctors to inhabitants is therefore much higher now than ever before. It should be borne in mind, however, that the scope of medical practice has enlarged considerably in the meanwhile, and many fresh openings for professional work have followed advances in diagnostic, curative, and preventive methods, and the rapid development of administrative medicine. On the whole, it appears that the medical profession of this country is now large enough, but not yet overstocked.

AFTER REGISTRATION: CHOICE OF CAREER

The student, having passed all his tests and placed his name on the *Medical Register*, assumes the privileges and responsibilities that go with legal qualification. But after registration there is usually a period of transition between pupilage and established practice. This time may be put to the greatest advantage by serving as house-physician, house-surgeon, or casualty officer in a hospital, by working as assistant or locumtenent in private practice, or by seeing something of the world as a ship surgeon. As a preliminary to practice of whatever kind, a year or more spent in junior hospital appointments is a most profitable investment.

If his mind is not made up already, the newly qualified practitioner has now to consider in which branch of the profession he can find a suitable outlet for his abilities. The choice is very wide, though the decision is often dictated rather by opportunity than by a nice balancing of tastes and talents. Among the great variety of paths open are general medical practice in town or country; Government service at home or abroad, including the medical branches of the Navy and Army, and Air Force, and the I.M.S.; public health appointments and other administrative or official posts; institutional work, such as that of the municipal hospital, the mental hospital, the fever hospital, and the sanatorium; academic positions in the various schools of medicine; and special work in scientific research or in one of the many subdivisions of clinical medicine and surgery. Most of these careers are discussed in some detail in the later sections, but a few words may be said here about general practice and the work of a consultant or specialist.

Further information about such matters will be found in the *Handbook for Recently Qualified Medical Practitioners*, published by the British Medical Association.[1] This comprises articles on openings for members of the profession; on practical aspects of medical work; on registration and the privileges of practitioners; on practice under the Insurance Acts; on post-graduation study and special diplomas; and on medical defence societies. The section dealing with practical aspects of medical work gives advice on professional conduct, on common medico-legal difficulties, and on the relations between doctor and patient and one doctor and another.

GENERAL PRACTICE

Three-quarters at least of those who pass out of the medical schools become "family doctors" sooner or later. The work is onerous and the pay too often inadequate; but it is a full life rich in human interest, and many of the very best students, now as formerly, choose general practice as a career. It is usually entered in one of three ways. The newcomer may take a house, put up a plate, and wait for work to come to him; he may buy the goodwill of a practice rendered vacant by retirement or death; or he may become a partner in an established firm. The first is considered more risky than the second, and the second than the third. A well-managed partnership of three or more has this advantage over single-handed practice, that it allows each partner leisure for recreation and for keeping up with the progress of medicine. Success in private practice demands a great deal of knowledge beyond that gained at the medical schools, and hence a man is more likely to be accepted as a partner, or to do well on his own account, if he has already some experience as an assistant or deputy.

The general practitioner cannot hope to be an expert in every department of medicine, but he should have a more comprehensive outlook than the man whose life is devoted to perfecting himself in the technique and minutiae of one subject. Both types of workers are indispensable in these days: they are complementary. The good general practitioner possesses powers of perspective in disease that are denied to the specialist, and he must remain not only the most useful and encyclopaedic working unit of our profession, but also the member of it to whom, at least in the first instance, the public, for its own good, should turn for relief in sickness and guidance in maintaining health. The opportunities he has of seeing his patients for minor ailments as well as for serious illnesses; his acquaintance with their family history, habits of life, social circumstances, and many other personal details learnt only after long and confidential intercourse, give the "G.P." just that knowledge which enables him to treat the patient and not merely the disease.

The value of the work done by the family medical attendant is better appreciated now than in the past. In its recent Proposals for a General Medical Service for the Nation[1] the British Medical Association puts the matter in the forefront. It states as an axiom that "the medical service of the community must be based on the provision for every individual of a general practitioner or family doctor"; and the whole series of proposals rests on this as a fundamental principle. In regard to the prevention of disease, on which the Association lays great stress in its memorandum, the general practitioner has an increasingly important part to play. Unlike the doctor of yesterday, his time is not now wholly spent in treating developed disease in individuals. As knowledge accumulates he will come more and more to study early disorders of function and the preservation of bodily and mental health in varying circumstances. While this is all to the good, it cannot be denied that encroachments on private medical practice are perpetually being made under the auspices

[1] *Supplement to the British Medical Journal*, April 26th, 1930. The memorandum in its revised form is also issued as a separate document by the British Medical Association.

of the State or of the municipality or of voluntary bodies, and that official requirements and administrative checks imposed by public authorities tend to increase.

"We are living in a transition period, and new methods of medical service are being created. Some plan must be devised whereby the family physician will remain the foundation of medical service, for his knowledge of the patient and his surroundings and his experience in such intimate and personal contact with patients makes him better qualified not only to diagnose and treat but also to direct the management of the case. His obligation is a serious one. No position in our social make-up requires a person of character and industry and deep appreciation of his moral responsibility more than does that of the general practitioner of medicine. With these attributes he has been a great success and will continue to be for a long time to come."[1]

The national system of compulsory health insurance, now more than nineteen years old, has had a profound influence on general medical practice in this country. The Insurance Acts provide domiciliary medical attendance for some sixteen million persons, and more than 17,000 members of our profession undertake responsibility for the medical care of this vast section of the community. Thus the bulk of the general practitioners of the country now give, in large or small measure, medical attendance and treatment under a system embracing almost the whole working population. These practitioners, by placing their names on the panel (or medical list), signify their assent to the terms of service set out in the Medical Benefit Regulations and other relevant provisions.

CONSULTANT AND SPECIALIST PRACTICE

The term "consulting practice" comprises in ordinary usage the work of the general physician, that of the general surgical consultant or operating surgeon, and that of the gynaecologist and obstetrician. These are the three large divisions of consulting practice, as distinct from general practice, which, though they imply some restriction, yet call for a wide range of activity and outlook, in contrast with the smaller ambit of a "specialty" in the narrow sense. Of these main divisions the third is obviously the most limited, but on several grounds it can claim to rank as something more comprehensive than the other specialties. No sharp line can, however, be drawn between consulting practice and specialist practice. Most general consultants, whether medical or surgical, are specialists in some branch of their practice, and most specialists are consultants in the sense that their work largely comes to them through the recommendation of general practitioners, with whom they act (or should act) in a consultative capacity. In any case, whoever holds himself out as one or the other, or both, is assumed to have knowledge and skill above the ordinary.

The successful pursuit of a specialty is hard to achieve except by the aid of appointments to hospitals, particularly those with medical schools. These posts are much sought after, and the time of waiting for a vacancy may be long. It follows, then, that the would-be specialist, since he can scarcely hope at first to pay his way by the exercise of his specialty, must either have private sources of income or be prepared, by teaching or in other ways, to make ends meet. Competition in this branch of practice is very keen. Expenses are heavy, and the young consultant or specialist may have to go through a long period of training and waiting before he makes an income; but on the other hand success, when it comes, is liberally rewarded.

"In the past the lean years of the waiting period were so difficult financially that it was often said that only men with private means could hang on, especially as physicians, with a view to consulting practice. There were, however, many exceptions then; and now, when the posts, such as registrarships at teaching hospitals, open to men at this stage, are much better paid, and there are far more scholarships and grants for original investigation, this difficulty is not so serious. But on the other hand, the possession of a comfortable income is far from an unmixed advantage, for it removes the poor man's obligation to scorn delights and live laborious days; no doubt the possessor of independent means can wait, but there is the danger that he may do little or nothing meanwhile. It has been said, with some degree of truth, that a consultant is made, not born, and there is no doubt that he has a hard task in making himself efficient and successful."[1]

In the larger industrial towns of the North of England there are many "general practitioner specialists" who combine ordinary panel practice with much surgical or other special work in well-equipped local hospitals which admit patients in different categories according to their means. Though the fees are small compared with those earned by operating surgeons and specialists in London, the work is by no means unremunerative.

Additional degrees and diplomas are important factors in securing election to the visiting staff of a large hospital, and a few remarks about them may be made here. Beyond the qualifications which admit to the *Medical Register*, most of the licensing bodies bestow higher titles after further tests. A considerable number of those who have graduated M.B. at a university, including many general practitioners, proceed later to the M.D. When applying for the post of physician to a hospital it is always useful, and may be obligatory, to hold also the Membership of one of the three Royal Colleges of Physicians, according to the part of the British Isles in which the hospital is situated. So, too, the Fellowship of one of the three Royal Colleges of Surgeons should be obtained by those seeking surgical appointments, and the degree of Master of Surgery is an added distinction. There are also diplomas in a growing number of special branches of work—such as public health, tropical medicine, ophthalmology, laryngology, radiology, tuberculosis, psychological medicine, and midwifery—which are superfluous for most practitioners, but may be useful or even indispensable for those who intend to devote themselves to one or other of these subjects. Information about the special diplomas open to qualified practitioners, and about higher degrees, will be found on other pages.

FINANCIAL AND SOCIAL ASPECTS

The rewards of a profession come under two heads: those that depend on the intrinsic pleasure of the occupation, and those associated with financial success and material dignity. The pecuniary disadvantages of medicine are the long and costly training, the time of waiting after qualification before the practitioner can count upon an adequate income, and the heavy working expenses in proportion to gross earnings. On the other hand, it holds out the prospect of a fairly certain income, with unrivalled opportunities for exercise of the intellect in the service of others. There are many briefless barristers, but the qualified practitioner of medicine should never want for a livelihood so long as he keeps his health and his good name. But while no doctor who is willing and able to work need starve—which can scarcely be said of any other learned profession—those who think of adopting it as a career ought to understand that medicine is a path to fortune only for the few. Yet if medicine, from the financial point of view, offers to most men little more than a means of livelihood always at command, in its social and cultural aspects the outlook is far brighter. As regards the satisfaction derived from the work itself, a doctor's life need yield to none in the matter of sustained and varied interest. His lot is unlike that of many whose business gives little scope to the higher faculties, for he lives in, and by, the exercise of his intellectual powers. The steady improvement in the education of the practitioner has added much to his

[1] E. Starr Judd: Presidential Address to the American Medical Association, June, 1931.

[1] Sir Humphry Rolleston: Address given at King's College Hospital, October, 1930.

influence with the public, and has been a large factor in raising his social status during the seventy-one years that have passed since the General Medical Council was constituted under the first Medical Act. Medicine gives to those who follow it an honourable position. The well-educated doctor stands high among his neighbours, and is the friend and confidant of his patients. Many men go further, and take a prominent part in the public life of their district. A proof of the all-round value of a medical training is the way in which it fits men for leadership.

PROFESSIONAL ORGANIZATION

All who follow the calling of medicine, varied as their work may be, constitute a single brotherhood bound together by common interests and aims. The spirit of comradeship, which counts for so much in student days, should be preserved, both for its own sake and because no doctor can safely hold himself aloof from his fellows. Individuals and isolated groups of practitioners are always at a disadvantage when they try to defend their interests against organized bodies, whether these are Government departments, local authorities, or commercial companies. In his daily work the doctor is well able to deal with the individual patient and the patient's friends, but he cannot stand up single-handed to outside organizations. Medical men and women must therefore band themselves together, and the first step after qualification should be to become an active member of the British Medical Association. Besides having behind him the machinery and the influence of a world-wide professional body, a young practitioner will find in the meetings of his local Division or Branch, and in the Annual Meetings of the Association, many opportunities for keeping abreast of new work and for friendly intercourse with colleagues. Another thing that no new graduate should fail to do is to join one of the societies which for a small yearly sum undertake individual legal defence of their members. The need for protection may arise out of the first case attended in hospital or in private practice.

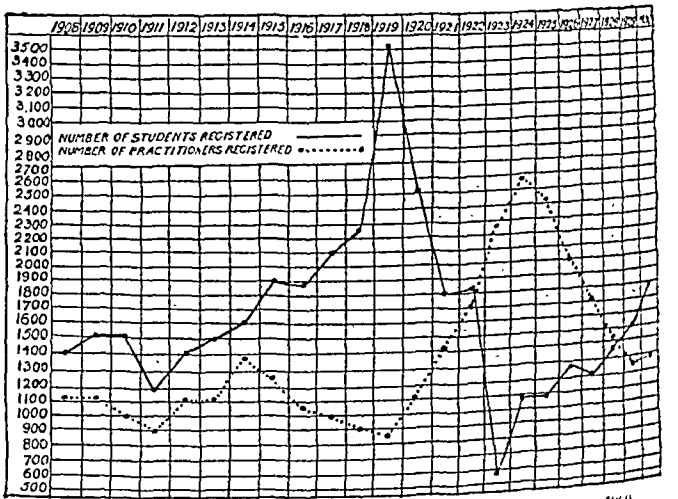
The British Medical Association was founded in 1832 to promote the medical sciences and maintain the honour and interests of the profession; a brief note on its constitution and activities will be found at page 480. The Association, with Branches throughout the British Empire and a membership of more than 35,000, is the only body that can act for the profession as a whole and speak in its name. The record of ninety-nine years' work shows that vocational organization, wisely directed, can combine service for its members with service for the public. Every medical man and woman should try to take a share in some of the movements, scientific or social or political, with which the Association has identified itself.

NUMBERS OF THE MEDICAL PROFESSION

A REVIEW OF FIFTY YEARS

In order to present a general view of the numerical strength of the medical profession during the past half-century we have extracted from the records and set down below in parallel columns the total number of names in the *Medical Register* on December 31st of each year, and the numbers added annually by registration between 1881 and 1930.

Numerical State of the "Medical Register."



Year.	Names added in Year.	Total No. on Dec. 31.	Year.	Names added in Year.	Total No. on Dec. 31.
1881	1,053	23,275	1906	1,197	39,529
1882	1,171	23,801	1907	1,221	39,827
1883	1,304	24,517	1908	1,137	40,257
1884	1,388	25,321	1909	1,143	39,818
1885	1,377	25,998	1910	1,062	40,483
1886	1,431	26,452	1911	1,042	40,913
1887	1,531	27,246	1912	1,157	41,439
1888	1,184	27,939	1913	1,168	41,940
1889	1,305	28,348	1914	1,433	42,378
1890	1,266	29,163	1915	1,526	43,225
1891	1,345	29,555	1916	1,202	43,481
1892	1,513	30,590	1917	1,134	43,819
1893	1,579	31,644	1918	1,077	43,926
1894	1,426	32,637	1919	1,322	44,510
1895	1,446	33,601	1920	1,457	44,761
1896	1,385	34,478	1921	1,760	45,408
1897	1,230	34,642	1922	1,983	46,476
1898	1,210	35,057	1923	2,482	48,140
1899	1,351	35,836	1924	2,796	50,035
1900	1,345	36,355	1925	2,570	51,738
1901	1,318	36,912	1926	2,120	52,614
1902	1,275	37,232	1927	1,941	53,769
1903	1,233	37,878	1928	1,656	54,336
1904	1,168	38,492	1929	1,410	54,870
1905	1,240	39,060	1930	1,490	55,291

The varying proportion of registered medical practitioners to population during the period under review is shown in the following table. This sets out the total population of the British Isles at each decennial census since 1881, and the number of names on the *Register* in the same year; also the corresponding totals for the mid-census year 1926.

Proportion of Practitioners to Population.

Year.	Registered Practitioners.	Population, British Isles.
1881	23,275	35,241,482
1891	29,555	38,104,975
1901	36,912	41,976,827
1911	40,913	45,370,530
1921	45,408	47,146,506
1926	52,614	48,190,000

These figures show a steady increase in the ratio of doctors to population, which was accelerated during the years immediately following the war. The number of registered practitioners at the end of 1921 was nearly double the number at the end of 1881, but the population of Great Britain and Ireland within that period of forty years only increased by about 34 per cent. There is now considerably more than one name in the *Medical Register* to every thousand of population. In the United States of America it is estimated that there is one medical practitioner to every 800 people. Next to the United States the British Isles appear to have the highest proportion of practitioners to population. Austria has approximately one doctor to every 900 inhabitants; Switzerland 1 to 1,250; Denmark 1 to 1,430; Hungary 1 to 1,480; Germany 1 to 1,560; France 1 to 1,690; Holland 1 to 1,820; Czechoslovakia 1 to 1,970; and Sweden 1 to 2,860.

Numbers of medical students and practitioners, 1908 to 1930.

REGISTRATION OF STUDENTS AND PRACTITIONERS

The relation between the numbers of new students and those of newly qualified practitioners during recent years is shown in the chart above, compiled from returns published by the General Medical Council.

The figures for the registration of practitioners year by year apply only to those whose names were entered on the

British list, entries in the colonial and foreign lists of the *Medical Register* being excluded; hence the slight discrepancy between the totals indicated in this chart and those given in our tables printed above. Some further remarks on the numbers of medical students in recent years will be found in our introductory article on the profession of medicine.

PROFESSIONAL STUDY AND EXAMINATION

THE MEDICAL CURRICULUM TO-DAY

In 1922 the General Medical Council prescribed a readjustment of the medical curriculum, to come into force at the beginning of the following year. The scheme adopted was in effect a compromise between several "schools of thought" which had been debating the matter for fifteen years or more. In this readjustment, among other things, increased emphasis was placed upon sufficient opportunity being afforded for the study, both theoretical and clinical, of those subjects which are now so essential in connexion with the treatment centres of a local authority, such as ophthalmology, venereal disease, orthopaedics, ante-natal conditions, and infant welfare. Our article, commencing on this page, on the functions and requirements of the General Medical Council, includes the text of the resolutions and recommendations of the Council which have applied since the beginning of 1923. We summarize below the leading features of the revised scheme of professional study and examination, and indicate the importance attached by the Council to the preventive aspects of medicine. The first qualifying examinations based upon this readjusted curriculum were held in 1928.

The minimum age for registration as a medical student is now 17 years. There has been no formal lengthening of the medical curriculum under the revised scheme, but in practice it has been added to by transferring to preliminary study and examination the subjects of elementary physics and chemistry in their purely scientific aspects. Thus, in addition to passing a preliminary examination in general education, an examination (written, oral, and practical) in the elements of physics and chemistry is required by the General Medical Council before the admission of a name to the *Students' Register*. In the applications of these two subjects to the professional courses—as in biophysics, biochemistry, and pharmacological chemistry—appropriate instruction is to continue throughout the curriculum, and is to be tested by examination, so that the student shall no longer be able to put behind him as past and done with the knowledge which he acquired as a preliminary. If he has had no facilities at school or otherwise for obtaining what is necessary for the preliminary or pre-registration examination in chemistry and physics, then he can come for it to the university or medical school, but study for this will not count as part of the medical curriculum. In elementary biology comparatively few secondary schools are equipped for tuition, but the General Medical Council has suggested an arrangement for utilizing the work of such schools as are qualified for the purpose. The examination in elementary biology will not be "pre-curriculum," but the instruction may be so, and a licensing body can allow students who so desire to sit for the examination immediately after matriculation. Here again, however, it is the wish of the Council that the applications of biology to medicine, surgery, and midwifery shall continue to receive adequate attention throughout the courses.

A BLOCK SYSTEM OF STUDY

Besides the resolutions of the General Medical Council in regard to professional education and examination printed elsewhere at page 422 a series of additional resolutions was adopted in 1922, as follows:

(*a*) That throughout the whole period of study the attention of the student should be directed by his teachers to the importance of the preventive aspects of medicine;

(*b*) That each licensing body should make adequate arrangements for the effective correlation of the several subjects of study throughout its curriculum;

(*c*) That the teaching of anatomy and physiology should include as a regular part of the courses the demonstration on the living human body of structure and function;

(*d*) That the curriculum should be so arranged that a minimum period of three years shall in every case be available for study after the completion by the student of the Professional Examinations in anatomy and physiology held at the close of the second year;

(*e*) That the curriculum should be so framed as to afford sufficient opportunities for the study, during the last three years of the course, of physics, chemistry, biology, anatomy, and physiology in their practical application to Medicine, Surgery, and Midwifery, and that the student's knowledge of these applications should be subject to test in the Final Examination;

(*f*) That before the student is admitted to his clinical appointments he should have received practical instruction in clinical methods and in the recognition and interpretation of physical signs;

(*g*) That instruction should be given, in the courses of Forensic Medicine and Public Health or otherwise, on the duties which devolve upon practitioners in their relation to the State, and on the generally recognized rules of medical ethics. Attention should be called to all *Notices* on these subjects issued by the General Medical Council.

The Council, it will be noted, attaches great importance to the reservation of sufficient time for the later subjects of study, free from all worries about passing the examinations of the earlier parts. To that end it recommends what is practically a block system. A minimum of three years should be available, not merely after the courses of anatomy and physiology have been taken, but after the examinations in these subjects have been passed. Another notable feature is that in assessing marks in the several examinations account may be taken of "duly attested records of the work done by the candidate throughout his course of study" in the subject. This is an effort to meet the long-felt difficulty that a man's mental agility, or the want of it, counts far too much in the examination room.

TRAINING IN PREVENTIVE MEDICINE

The first of the resolutions quoted above should be borne in mind by every teacher throughout the whole curriculum, and not merely in the clinical subjects. All the earlier subjects—physics, chemistry, biology, physiology, anatomy, and, of course, pathology, bacteriology, and therapeutics also—afford opportunities from the very beginning for instilling into the mind of the student the necessity for his keeping constantly in view, in all the advice and treatment he may give throughout his professional life, the primary importance of promoting the general health of those who entrust themselves to his care, and of preventing trivial ailments from developing into definite disease.

The General Medical Council

The General Medical Council was established by the Medical Act, 1858, in order "that persons requiring medical aid should be enabled to distinguish qualified from unqualified practitioners." It consists of eighteen members appointed by the Universities in the United Kingdom having medical faculties; of nine members appointed by the Medical Corporations, such as the Royal Colleges of Physicians and Surgeons; of five members appointed by His Majesty in Council; and of six members directly elected by members of the profession as a whole—a total of thirty-eight. To these are added three dentists who are members of the Dental Board, and are appointed for dental business. Although the eighteen members appointed by the Universities and the five members appointed by

His Majesty in Council may all be laymen, only one layman has so far been appointed, and that was by the Privy Council in 1926.

The Council's offices are at 44, Hallam Street, Portland Place, London, W.1, and it has Branch Offices at 12, Queen Street, Edinburgh, and 35, Dawson Street, Dublin.

The Council exists for the protection of the public and not of the profession. Its principal functions are three. First, to keep the *Medical Register*; second, to see that the name of no person is entered thereon as qualified unless he has had an adequate professional education, and to remove therefrom the names of qualified persons who are no longer entitled to public confidence; and third, to provide for the publication of the *British Pharmacopoeia*. It is the appearance of a name upon the *Medical Register*, and not the possession of a degree or diploma, that constitutes a person a duly or legally qualified practitioner of medicine.

The Council has no power to make rules in regard to the medical curriculum or examination, but it can pass resolutions and make recommendations relating thereto, and, if any of these were ignored by the licensing bodies, it would be open to the Council to make representations to the Privy Council, which, if it thought fit, might order that the qualifications obtained from such bodies should not be registrable.

The name of any medical practitioner who has been convicted of *felony or misdemeanour*, or who is proved before the Council itself to have been guilty of "infamous conduct in a professional respect," may be erased from the *Medical Register*.

The Medical Acts prohibit attempts being made to impose restriction as to any theory of medicine or surgery, and, once a practitioner has been trained and tested in the knowledge essential for public safety, he may adopt any "theory" of medicine or surgery in which he honestly believes. The Medical Acts do not prohibit the practice of medicine by unregistered persons, but if they "wilfully and falsely" assume any title implying registration they are liable to prosecution. In this respect the Medical Acts differ from the Midwives and the Dentists Acts, which entirely preclude the practice of midwifery or dentistry by unregistered persons. Unregistered medical practitioners, however, are under certain disabilities, for they cannot recover charges for medical or surgical attendance, etc., in a court of law; they cannot hold an appointment as a medical officer in the Military or Naval Services, or on ships; they cannot give any valid certificate which is required by any Act from a medical practitioner—for example, certificate of death; and they cannot obtain dangerous drugs or attend cases of venereal disease.

An account of the recommendations that the Council has drawn up in respect of the education of medical students here follows.

REGISTRATION OF MEDICAL STUDENTS

The Council recommends that every intending student of medicine should be registered as such at one of its three offices, whose addresses are given on page 421.

Candidates must produce evidence (*a*) that they have attained the age of 17 years; (*b*) that they have passed an examination in general education which is accepted for matriculation or entrance to the Faculties of Arts or Pure Science in a university in the United Kingdom; and in addition thereto that they have passed an examination in elementary chemistry and elementary physics conducted or recognized by one of the licensing bodies.

Application for registration should be addressed to the Registrar for the Division of the United Kingdom in which the applicant is residing—England and Wales, or Scotland, or Ireland. It must be made on a special form, which can be obtained from one of the offices of the General Medical Council itself or from one of the various licensing bodies and medical schools.

The regulations with regard to registration apply equally to medical and dental students, with the exception that in the case of the latter, pupilage with a registered dental practitioner may be regarded as a commencement of professional study, and that applications for registration should be addressed to the London office only.

PROFESSIONAL EDUCATION

The rule is that it is only from the date which appears against his name in the *Students Register* that the medical student's career officially begins; thereafter five years at least must pass before he can present himself for the first examination for any diploma which entitles its lawful possessor to registration as a qualified medical practitioner under the Medical Acts; but to meet the circumstances brought about by the dates at which sessions of the medical schools begin and end, the close of the fifth year may be reckoned as occurring at the expiration of fifty-seven months from the date of registration. In any case, the period of five years must be one of bona-fide study; and in every course the following subjects should be included:

(i) Elements of General Biology, including an introduction to Embryology. This course, if the licensing bodies permit, may be taken before registration, and the examination may be passed immediately after registration.

(ii) Chemistry, Physics, and Biology in their application to Medicine.

(iii) Human Anatomy and Physiology, including Histology, Elements of Embryology, Biochemistry, and Biophysics

(iv) Elementary Bacteriology, prior to regular clinical appointments.

(v) Pathology, general, special, and clinical, and Morbid Anatomy.

(vi) Pharmacology and Materia Medica, to be taken concurrently with clinical instruction.

(vii) Forensic Medicine, Hygiene, and Public Health

(viii) Medicine, including Applied Anatomy and Physiology, Clinical Pathology and Therapeutics, Children's Diseases, Acute Infectious Diseases, Tuberculosis, Mental Diseases, Skin Diseases, and Vaccination.

(ix) Surgery, including Applied Anatomy and Physiology, and Clinical Pathology, Anaesthetics, Diseases of the Eye, Ear, Throat, and Nose, Radiology, Venereal Diseases, and Orthopaedics.

(x) Midwifery and Diseases of Women, including ante-natal conditions and infant hygiene.

The Council recommends that during the last three of the five academic years clinical subjects shall be studied

The first two years must be passed at a university, or at a school of medicine recognized by any of the licensing bodies enumerated in the schedule to the Medical Act of 1858, and the remainder must be devoted to clinical work at any public hospital or dispensary at home or abroad which is recognized by a licensing body.

SPECIAL CONSIDERATIONS

The requirements of the General Medical Council in respect of the education of those who desire to enter the medical profession have now been given in outline, but before leaving this part of the subject the steps which the aspirant should take may be rehearsed in their due order.

(1) Pass an examination in arts;

(2) Pass an examination conducted or recognized by a licensing body in elementary physics and elementary chemistry;

(3) Having attained the age of 17, enter himself at a university or at a medical school recognized by one of the licensing bodies;

(4) Obtain registration as a medical student;

(5) Study for a minimum of five years certain prescribed subjects;

(6) Meanwhile pass sundry intermediate examinations; and at the end of the fifth year pass a "qualifying examination" which will entitle him to receive from a licensing body a qualification enabling him to obtain registration in the *Medical Register*, whereby he receives legal authority to practise.

The Minimum Period.—It must be remembered that the period of five years is a minimum; more is often required, even by the man of good abilities and reasonable industry, and some of the universities prescribe a longer period. Besides these qualities a student, to obtain a registrable qualification in the minimum period of five years, or fifty-seven months, must have a considerable amount of good luck; in other words, he must keep in good health through every term, and never fail at a single examination. Thus, for instance, before presenting himself for any examination he must be "signed up" for the subjects covered by that examination; this means that his teachers have to certify that he has diligently attended the required number of lectures or classes in the subjects in question. If, however, the student happens to be ill during the term when such lectures or classes are taking place he may miss enough of them to make it impossible for him to be signed up. Then again, should he fail to satisfy the examiners at some examination, he cannot present himself for re-examination for at least three months. This generally entails further consequences, because, apart from the student's success at the next stage in his career being imperilled by the need for restudying the subjects in which he has failed, the Examining Boards usually insist upon a definite interval elapsing between one examination and the next. Further, many Boards have refused to recognize lectures and classes which have been attended before the student has passed the requisite examination in earlier subjects, and the Council now recommends that the professional examinations in anatomy and physiology be passed before the minimum period of three years' subsequent study be entered on; in other words, no clinical study should count as such until these examinations have been successfully completed. Failure at an examination may thus not only mean deferment of the date of examinations, but deferment of the beginning of the student's study of certain subjects. It is thus exceedingly easy for a student to fail to qualify in five years, and, as a fact, the majority of students take longer.

In speaking of the minimum period, it is to be remembered also that that time is only sufficient to gain a registrable qualification, such as a Bachelorship of Medicine or Surgery or the diplomas of the Royal Colleges. Those who wish to take a higher qualification—for instance, the F.R.C.S.Eng.—must prolong their work for another year or more. So, too, must in some cases those who desire to convert their Bachelorship into a Doctorate. This may entail further formal examination, but at some universities the M.D. is obtainable on presentation of a thesis when the Bachelor has attained a certain age and has practised for a certain number of years. However, a student's career proper may be considered, perhaps, to have ended when he obtains his first registrable qualification, for while preparing himself for any further tests he can, and usually does, hold some junior appointment which more or less covers his expenses.

MEMORANDUM ON STUDENTS' REGISTRATION

The following memorandum has been drawn up by the Registrar of the General Medical Council as to the procedure for those who desire to be registered as medical or dental students.

The requirements for the registration of medical and dental students are the same, and every intending student should, in his own interest, register as soon as he commences his professional curriculum.

A recognized examination in general education must first be passed. If the student intends to obtain a university degree, he should apply to the university he selects for information as to its matriculation requirements in arts or pure science, or as to any examinations which may be accepted in fulfilment thereof. If the student intends to obtain a qualification from one of the licensing corporations (these are the Conjoint Boards in England, Scotland, and Ireland, the Society of Apothecaries of London, and the Apothecaries' Hall of Dublin), any of the examinations indicated below will be accepted. The subjects required are: (1) English, (2) Mathematics (elementary), (3) a language other than English, and (4) a fourth subject as required by the regulations of the particular examination, to be chosen from the following—namely, History, Geography, Botany, Physical Science, Natural Science, Latin, Greek, Hebrew, French, German, or other language accepted by a university for matriculation. School certificates (other than "Higher") must show "Credits" in each of the prescribed subjects. When school certificates with four credits are presented, or certificates from the Educational Institute of Scotland and College of Preceptors, the passes in the four subjects must be shown to have been obtained at not more than two sittings.

The requirements of the preliminary examination in general education being satisfied, it is then necessary for the student to pass a further or pre-registration examination (theoretical and practical) in elementary chemistry and elementary physics, which is conduct[illegible] of the licensing bodies—that is, a [illegible]poration. These subjects must be [illegible] included in the preliminary examination—for example, chemistry taken as one of the four required subjects in the preliminary examination cannot also count as one of the subjects of the pre-registration examination. These subjects may be studied at a university or medical school, or at a secondary school or other institution recognized by the body whose pre-registration examination it is intended to take. The student should, in every case, write beforehand to the body whose qualification he desires to obtain (a list will be found below) for information in regard to its requirements for this examination.

These two examinations (in general education and in physics and chemistry) having been passed and the student having attained the age of 17 years, he should apply to one of the universities or one of the medical schools for admission to its course of medical study. When medical study has been begun, he should apply to the Dean of the School, or to the Registrar of one of the branches of the General Medical Council, for a form of application for registration as a student, and should have it completed and sent in to one of the Branch Councils as soon as possible. There is no fee for this registration. The medical curriculum will extend for at least five years, and the dental curriculum for at least four years, from the date of registration as a student.

A student who has, before registration, studied the subject of elementary biology at an institution recognized by one of the licensing bodies may, if the body sees fit, be admitted to the professional examination in this subject immediately after his registration as a student. For information in regard to this he should apply to the body whose medical qualification he seeks.

A dental student may commence his curriculum, if he so desires, as a pupil in dental mechanics of a registered dental practitioner; but study at a dental school is to be preferred. If, however, he is apprenticed to a dental practitioner, he will have to devote twice as much time to instruction in dental mechanics as he would if he had taken this subject in a school. This will have the effect of lengthening the curriculum. In any case a student can only obtain a concession of twelve months out of the four years' curriculum.

The addresses of the Branch Registrars are:

General Medical Council, 44, Hallam Street, Portland Place, London, W.1.
Scottish Branch Council, 12, Queen Street, Edinburgh.
Irish Branch Council, 35, Dawson Street, Dublin.

Examining Bodies in Preliminary Education

The following is a list of the officials of the examining bodies in preliminary education, with the names of the examinations in parentheses.

Registrar, Queen's University of Belfast. (Matriculation.) Assistant Secretary, Ministry of Education. (Second Certificate.)
Registrar, The University, Bristol. (Matriculation, School Certificate, or Higher School Certificate.)
Registrary, The University, Cambridge. (Previous.)
Secre[illegible] Examinations, Syndicate Buildings, C[illegible]igher School Certificate.)
Medi[illegible] of Dublin School of Physic, Dublin. ([illegible] Preliminary, Junior Exhibition, or Examination for first, second, third, or fourth year in Arts.)
Registrar, University of Durham College of Medicine, Newcastle-on-Tyne. (Matriculation, School or Higher School Certificate.)
Registrar, Irish Conjoint Board, Royal College of Surgeons, Dublin. (Preliminary Examination.)
Registrar, National University of Ireland, Dublin. (Matriculation.)
The Assistant Commissioner of the Department of Education, 1, Hume Street, Dublin. (Senior Grade Examination or Leaving Certificate.)

Assistant Secretary, Ministry of Education, Belfast (Senior Grade or Leaving Certificate)
Academic Registrar, The University of London, South Kensington, London, S W 7 (Matriculation, General, or Higher School Certificate)
Secretary, Northern Universities Joint Matriculation Board, 315, Oxford Road, Manchester (Matriculation, School, or Higher School Certificate)
Registrar, University Registry, Oxford (Responsions)
Secretary, Oxford and Cambridge Schools Examination Board, Schools Examination Office, Balliol College, Oxford (School or Higher School Certificate)
Secretary, Oxford Local Examinations, University Press, Oxford (School or Higher School Certificate)
Secretary, College of Preceptors, Bloomsbury Square, London, W C 2 (Senior Certificate)
Secretary, Educational Institute of Scotland, 47, Moray Place, Edinburgh (Preliminary Medical Certificate)
Secretary, Scottish Education Department, 14, Queen Street, Edinburgh (Leaving Certificate)
Secretary, Scottish Universities Entrance Board, 81, North Street, St Andrews (Scottish Universities Entrance Examination)
Registrar, University of Wales, Cathays Park, Cardiff (Matriculation)
Clerk, Central Welsh Board, Cardiff (School or Higher School Certificate)

[*Note*.—Certificates of the College of Preceptors and School Certificates (other than "Higher") must show "Credits" in each of the prescribed subjects.]

Licensing Bodies

The following is a list of the officials of licensing bodies and their addresses

Secretary, English Conjoint Board, 8, Queen Square, Bloomsbury, W C 1
Clerk, Society of Apothecaries, Blackfriars, E C 4
Dean Department of Medicine, Oxford
Registrary, The University, Cambridge
Registrar, University of Durham College of Medicine, Newcastle-on-Tyne
Principal Officer University of London, South Kensington, S W 7
Registrar, Victoria University, Manchester
Registrar, The University, Birmingham
Registrar, The University, Liverpool
Registrar, The University, Leeds
Registrar, The University, Sheffield
Registrar, The University, Bristol
Registrar, University of Wales, Cathays Park, Cardiff
Secretary, Scottish Conjoint Board, 49, George Square, Edinburgh
Dean of the Faculty of Medicine, The University, Edinburgh
Registrar, The University, Glasgow
Registrar, Royal Faculty of Physicians and Surgeons, Glasgow (*Dental*)
Secretary of the Medical Faculty, The University, Aberdeen
Secretary, The University, St Andrews
Secretary, Irish Conjoint Board, Royal College of Surgeons, Dublin
Registrar, Apothecaries' Hall of Ireland, 95, Merrion Square, Dublin
Medical Registrar, The University, Trinity College, Dublin
Registrar, National University of Ireland, University College, Dublin
Secretary, Queen's University, Belfast

Medical Schools

The following is a list of medical schools (other than universities) and their officials

Registrar, College of Medicine, Newcastle-on-Tyne
Dean of the Medical College, St Bartholomew's Hospital, London, E C 1
Dean of the Medical School, Charing Cross Hospital, W C 2
Dean of the Medical School, St George's Hospital, S W 1
Dean of the Medical School, Guy's Hospital, S E 1
Dean of the Medical School, King's College, Strand, W C 2
Dean of the Medical School, King's College Hospital, S E 5
Dean of the Medical College London Hospital, E 1
Dean of the Medical School, St Mary's Hospital, W 2
Dean of the Medical School, Middlesex Hospital, W 1
Dean of the Medical School, St Thomas's Hospital, S E 1
Dean of the Medical School, University College Hospital, W C 1
Dean of the Medical School, Westminster Hospital, S W 1
Dean of the School of Medicine for Women, 8, Hunter Street, W C 1
*Registrar, University College, Aberystwyth
*Registrar, University College, Bangor
*Registrar, University College, Cardiff
Dean of the Medical School, Welsh National School of Medicine, Cardiff
Dean of the Medical School, University College, Swansea
Dean of the Medical School, University College, Dundee
Dean, School of Medicine of the Royal Colleges, Surgeons' Hall, Edinburgh
Dean, St Mungo's College, Glasgow
Dean, Anderson's College of Medicine, Glasgow.
Mistress, Queen Margaret College, Glasgow
Registrar, University College, Cork
Registrar, University College, Dublin
Secretary, School of Medicine, Royal College of Surgeons, Dublin
Registrar, University College, Galway

* First year only

PROFESSIONAL EXAMINATION

The Council's Recommendations

The following recommendations of the General Medical Council in regard to professional examinations for medical and surgical qualifications were adopted in May, 1922

1 In order to secure due continuity and sequence in the study, two or more professional examinations in the elementary subjects should be held antecedently to the Final Examination in medicine, surgery, and midwifery

2 Three years at least should intervene between the date of passing the professional examination in anatomy and physiology and that of admission to the Final Examination in medicine, surgery, and midwifery

3 A candidate remitted in any subject of a professional examination should, before he is readmitted to examination therein, be required to produce satisfactory evidence that he has, during the interval of remission, pursued the study of the subject in which he was rejected Candidates who obtain less than 30 per cent of the marks in any subject should be remitted for a longer period than three months

4 In all the professional examinations sufficient time should be assigned to practical work, in order to test the thoroughness of the candidate's knowledge and to encourage practical methods of study

5 Candidates in all their examination work should be carefully supervised

6 Two examiners should always participate in the final examination of a candidate, except in subordinate parts of practical examinations

7 In all written examinations the questions in each subject should be submitted for the approval of all the examiners in that subject

8 In all written examinations an average of at least half an hour should be allowed for a candidate to answer each question

9 It is desirable that examiners, and in particular those in the Final Examination in medicine, surgery, and midwifery should be appointed or re elected for at least three consecutive years

10 Whatever may be the system of marking the percentage for a pass in each subject should not be less than 50

11 In the regulations for the several examinations it should be provided that examiners, in assessing marks, be empowered to take into account the duly attested records of the work done by the candidate throughout his course of study in the subject of the examination

12 The Final Examination in medicine, surgery and midwifery, with the exception of the clinical and practical examination in midwifery and gynaecology, must not be passed before the close of the fifth academic year of medical study

13 The three portions of the Final Examination in medicine, surgery, and midwifery should not be further subdivided into sections which may be entered for or passed separately

14 Compensation in respect of marks as between the three different portions of the Final or Qualifying Examination—namely, medicine, surgery, and midwifery—is contrary to the intention of the Medical Act (1886)

15 The Final Examination should include clinical and practical examinations in midwifery and gynaecology

16 The clinical examination in medicine surgery and midwifery should be held in properly equipped hospitals or examination halls well provided with suitable patients

17 In the examinations in clinical medicine at least one hour, and in clinical surgery at least half an hour should be allowed to the candidate for the examination of, and report on his principal case.

18 In medicine, in surgery, and in midwifery, no candidate should be allowed to pass who fails to obtain 50 per cent of the aggregate marks assigned to the whole examination or who fails to obtain 50 per cent of the marks assigned to the clinical examination, or who fails to obtain 40 per cent of the aggregate of the marks assigned to the written and oral examination In midwifery, where a clinical examination is not held, the duly attested records of the work done by the candidate in clinical midwifery must be presented to the examiners for assessment in the Final Examination, and no candidate should be allowed to pass who fails to obtain 50 per cent of the aggregate marks assigned to clinical and practical midwifery and gynaecology.

19 The Final Examination should include the examination of secretions the testing of urine, clinical microscopy, prescription writing, and there should always be an examination in medicine, surgery, and midwifery, which should include an examination on pathological specimens

20 At the Final Examination each candidate should be committed to a practical and oral examination in pathology (macroscopic and microscopic), unless this has been included in a professional examination preceding the Final Examination

21. Whatever be the method of entry for the Final Examination, all candidates should be required to complete the three portions of the Final Examination within a period of nineteen months.

This section of the Educational Number would be incomplete without brief mention of the memorandum, drawn up by the Registrar of the General Medical Council, on the procedure to be adopted by those who desire to enter the profession of medicine, to which reference is made in the introductory article at page 415. This pamphlet (price 1s. post free) sets out in plain language the information for which the Registrar is often asked by prospective medical students or their guardians.

Universities in England and Wales

There are eleven universities in England and Wales, and some account of each of them follows. They all have now fully developed medical faculties.

UNIVERSITY OF OXFORD

The professional degrees conferred by this university are those of Bachelor of Medicine (B.M.), Bachelor of Surgery (B.Ch.), Doctor of Medicine (D.M.), and Master of Surgery (M.Ch.). It also grants a diploma in ophthalmology. On receiving the B.M. the candidate is entitled to registration by the General Medical Council. In favourable circumstances this degree and the B.Ch. may be obtained in six or seven years from matriculation. Before receiving either, the candidate must have taken a degree in arts (B.A.), for which three years' residence within the university is necessary. This, however, does not necessarily mean deferment of professional study for that period, for the subjects chosen for the arts course may be to a great extent the same as those in which examinations would in any case have to be passed for the medical degree, and the courses are dovetailed together.

In accordance with a statute which came into force on October 7th, 1920, women may be matriculated and admitted to degrees in the university. The statute is retrospective under certain conditions. Before matriculation a woman must have been admitted as a member of one of the five societies of women students (Lady Margaret Hall, Somerville College, St. Hugh's College, St. Hilda's Hall, or the Society of Oxford Home Students). Women members of the university are admitted to all degrees, except those in divinity, under the same conditions as those laid down for men in regard to examinations, courses of study, and fees, and under corresponding conditions as to residence at the university. Among the university diplomas open to women are those in anthropology and ophthalmology.

There are numerous avenues to the B.A. degree, but that which constitutes the *normal* course for medical students, as being the most closely related to their medical studies, is the following. By passing Responsions (or one of the examinations which are accepted as equivalent), the Scripture examination, some of the preliminary examinations in the Natural Science School,[1] in the first public examination, and one of the final honour examinations in the Final Honour School of Natural Science—physiology being that usually taken.

Responsions and the preliminary examinations in natural science may be passed before a candidate is a member of the university[2], a Final Honour School may be taken at the end of the third or fourth academical year—that is, within nine or twelve terms respectively; the preliminary examinations of the Natural Science School may be taken as soon as Responsions has been passed or exemption obtained.

[1] The four subjects of the medical preliminary examinations are four of the subjects in the natural science preliminary, and can be commenced directly after passing Responsions.

[2] Membership is constituted by Matriculation and by becoming either a member of a College or a Hall or a non-collegiate student.

PROFESSIONAL DEGREES

To obtain the B.M., B.Ch. degrees the candidate must first pass in four of the subjects of the preliminary examination of the Natural Science School—namely, physics, chemistry, zoology, and botany.

He then has two further examinations to pass—the First B.M. and the Second B.M. These take place twice a year, the first on the Thursday, the second on the Wednesday, of the eighth week of Michaelmas and Trinity terms. Every candidate at the first B.M. is examined in human anatomy, in physiology, and in organic chemistry, but is excused from physiology if he has obtained a first or second class in the Honour School of Physiology, and from organic chemistry if he has satisfied the examiners in Part I of the Honour School of Chemistry. Once he has passed this examination he can, on production of certain certificates, be examined as soon as he pleases in pathology, forensic medicine and hygiene, materia medica, and pharmacology (subjects of the Second Examination), but cannot present himself for the remaining subjects—medicine, surgery, and midwifery—until the eighteenth term from the day of his matriculation *unless he be already a registered medical practitioner*, and not until a period of at least thirty three months has elapsed from the date of his passing the First Examination, and he must pass in all the three subjects at one and the same time.

Before admission to the Second B.M. examination the student must produce certificates of instruction from a medical school recognized by the university, of having acted as clinical clerk and dresser, each for six months, and as post-mortem clerk for three months, of attendance on labours, of instruction in infectious and mental diseases and ophthalmology, and of proficiency in vaccination and the administration of anaesthetics,[1] and of three academic years of hospital attendance. He must also produce certificates of attendance in laboratory courses in pathology, bacteriology, and pharmacology, either in Oxford or in a recognized medical school.

D.M. AND M.CH. DEGREES

A Bachelor of Medicine who wishes to proceed to the D.M. must have entered his thirtieth term and must present a dissertation for approval by the appointed examiners on a subject previously approved by the Regius Professor of Medicine. If a candidate for the M.Ch. he must have entered his twenty-first term and must pass an examination, which is held in June.

The examination for the diploma in ophthalmology is held annually in June.

TEACHING

The several colleges provide their undergraduate members with tutors for all examinations up to the B.A. degree. In addition, the university provides certain courses of instruction, including lectures, demonstrations, and practical work, which cover all the subjects of the Preliminary Examination and First B.M., and to some extent those of the Final Examination.

SCHOLARSHIPS

Most colleges grant scholarships open to intending medical students of the maximum value of £100 a year, tenable for four years, in natural science, chemistry, physics, and biology. Exhibitions of varying value are also awarded in these subjects. At two colleges (University and Pembroke) there are medical entrance scholarships of £100 a year. Particulars can be obtained on application to the college tutors. Scholarships for women are also offered by the various women's colleges; from the principals of which details of the examinations may be obtained. A Radcliffe Travelling Fellowship of £300 a year, tenable for two years, is conferred annually; candidates must have taken the B.M. degree. A Schorstein Research Fellowship of £200 a year for two years is awarded biennially. The Fellow must engage in research in one of the medical departments of the university. A George Herbert Hunt Travelling Scholarship of about £100 is awarded biennially to enable a young medical graduate to spend three months abroad in medical study. A Philip Walker Studentship in Pathology

[1] For the certificates that will be required from candidates amenable to the new Regulations of the General Medical Council, see *Examination Statutes*, Clarendon Press, Oxford, 1930 edition.

of £200 a year, tenable for two years, is awarded biennially for the encouragement of research in pathology, as also are the Rolleston Memorial Prize and the Radcliffe Prize (£50), for research in natural science (including pathology), and the three Theodore Williams Scholarships in Anatomy, Physiology, and Pathology, of the value of £50 each, tenable for two years. A Radcliffe Scholarship in Pharmacology of £50 for one year, open to the university, is awarded annually by the Master and Fellows of University College.

FEES

An annual fee of £4 10s. is paid to the university for the first four years, being reduced to £1 when the B.A. has been taken. For the degree the fees are: the B.A., £7 10s.; the B.M. and B.Ch., £14; the D.M., £25; the M.Ch., £12. College fees, varying in amount, are paid for the first four years of membership and in taking degrees. Tuition fees vary from £21 to £30. The minimum annual cost of living during the three university terms may be regarded as not less than £200, or for women not less than £140.

For further information application may be made to Dr. M. H. MacKeith, Dean of the Medical School, University of Oxford.

UNIVERSITY OF CAMBRIDGE

The professional degrees given by this university are those of Bachelor of Medicine (M.B.) and Bachelor of Surgery (B.Chir.), each of which entitles the possessor to admission to the *Register* by the General Medical Council, and the higher degrees of Doctor of Medicine and Master of Surgery. It also grants a diploma in medical radiology and electrology to medical practitioners, not necessarily graduates of the university. Information regarding this diploma will be found in a later section under the heading Radiology. A candidate for the M.B., B.Chir. degrees need not possess a degree in arts; it is sufficient if he has passed the Previous Examination or some other examination accepted by the university as its equivalent. Most students, however, are advised to take the B.A. degree, preferably by obtaining honours in the Natural Sciences Tripos. The attainment of a sufficient standard in certain subjects in this Tripos will secure exemption from the corresponding tests in the First and Second M.B. examinations in the case of students who take up medical study late in their university career. Members of Girton College and Newnham College are admitted to the examinations.

PROFESSIONAL EXAMINATIONS

To obtain the M.B. degree the candidate must pass three examinations and keep an Act. The B.Chir. degree (which is a registrable qualification) may be obtained after passing all three examinations.

First M.B.—This comprises (1) general and inorganic chemistry, (2) mechanics, (3) physics, (4) elementary biology. The parts may be taken together or separately. In either case the candidate, before admission to examination, must have passed or been exempted from the Previous Examination. Certain exemptions from the First M.B. Examination are allowed; the regulations may be obtained from the Registrary. The examination is held three times in the year.

Second M.B.—This examination comprises: Part I, organic chemistry; Part II, human anatomy and physiology; Part III, elementary pharmacology, including pharmaceutical chemistry and the elements of general pathology. No student is admitted to the first part of the Second Examination until he has completed the Previous Examination and the first part of the First Examination. No student is admitted to the second part of the Second Examination until he has passed all parts of the First Examination and has been matriculated. No student is admitted to the third part of the Second Examination until he has passed the first and second parts of the Second Examination. The candidate must present certificates of study in the subjects of the second and third parts. The examinations for Part I are held in October, December, and June, and for Part II in December and June; that for Part III in October and April.

Third M.B.—This is divided into two parts, to neither of which the candidate is admitted until he has passed the examinations previously mentioned. A candidate for the first part, which deals with the principles and practice of surgery (including special pathology) and midwifery and diseases peculiar to women, must have completed five years of medical study and be signed up in these subjects, and have completed two years and a half of hospital practice. Before admission to the second part the candidate must have completed five years of medical study, and be duly signed up in all subjects and have completed three years of hospital practice. The examination is in the principles and practice of physic (including diseases of children, mental diseases, and medical jurisprudence), pathology (including hygiene and preventive medicine), and pharmacology (including therapeutics and toxicology). The Third M.B. examinations are held twice a year—in June and December.

Act for the M.B.—Before receiving his M.B. degree a candidate who has passed the Third M.B. examinations has to write a thesis. This he reads in public on an assigned day, and is then questioned concerning it and other subjects of medicine by the Regius Professor of Physic. If approved at this test he is then certified as *having "kept the Act," and in due course* receives his degree. Medical degrees may be taken in absence by those living abroad, the candidate sending to the Registrar a dissertation, which is laid before the Degree Committee.

THE HIGHER DEGREES

The M.D. degree may be taken by a Bachelor of Medicine of three years' standing (and a Master of Arts of four years' standing who has completed the course required for M.B.) after writing a thesis approved by the M.D. Degree Committee, and keeping a further Act, at which he reads his thesis and is examined thereon. Previously to the Act being kept a topic taken from the general subject of his thesis (whether it be physiology, pathology, pharmacology, practice of medicine, State medicine, or the history of medicine) is submitted to the candidate, on which he is required to write an extempore essay.

A candidate for the M.Chir. degree who is an M.A. may be admitted to the examination after he has become legally qualified to practise surgery. Other candidates may be admitted when two years have elapsed after they have passed the Third M.B. Examination. The examination comprises pathology, surgery, surgical anatomy, and surgical operations. The tests are partly in writing, partly oral, and partly practical: they include the writing of an extempore essay. The examination is held in February in each year.

FEES

In addition to college fees, tutorial fees, and the expense of living, the following examination fees are payable: First M.B., £5 5s.; Second M.B., £6 6s.; Third M.B., £10 10s. For schedules referring to the examinations, lists of schools recognized by the university, and other information, application should be made to the University Registrary, Cambridge.

UNIVERSITY OF LONDON

Under the regulations of the University of London the degrees obtainable in the Faculty of Medicine are those of Bachelor of Medicine and Bachelor of Surgery, Master of Surgery in four branches, Doctor of Medicine in six different branches, Bachelor of Dental Surgery, and Bachelor of Pharmacy. The university has its own matriculation examination, and it is very advisable that candidates should obtain and carefully study the booklets relating to it. The matriculation examination is open to any person, of either sex, who has attained the age of 16. It is held in January, June, and September, and lasts four days; the first two take place both in London and in certain provincial centres; the September examination is *held in London only.*

In no circumstances is a degree granted to *anyone* in less than three years after the date at which he passed the matriculation examination or obtained registration in some other way; and, unless they are already registered medical practitioners of a certain standing, all medical students must pass not less than five and a half years in professional study subsequent to matriculation, of which the last three years must be spent at a school of advanced medical studies.

PROFESSIONAL EXAMINATIONS

M B , B S—There are three examinations the last two being subdivided They are held twice a year

The First Examination (held in July and December) covers inorganic chemistry, general biology, and physics, there being two papers a practical test and a possible oral test in each subject The names of successful candidates are placed in alphabetical order, with a note as to any subject in which a candidate has distinguished himself or herself

The Second Examination is held in March and July Part I covers organic chemistry, the candidate's knowledge being tested as in the earlier examination Candidates for Part II must have passed the First Examination at least eighteen months previously, besides having completed Part I of the Second Examination The subjects are anatomy physiology, and pharmacology, the tests being written, oral, and practical Candidates who fail in pharmacology may sit for re examination in that subject alone if the examiners think fit, and candidates who pass in pharmacology only may similarly be credited with that subject

No candidate, unless he is already a registered medical practitioner is admitted to the Third M B , B S Examination within three academic years from the date of his completing the Second Examination The subjects are medicine (including mental diseases), pathology forensic medicine and hygiene surgery and obstetrics and gynæcology They may be divided into two groups one comprising medicine pathology, forensic medicine, and hygiene, and the other surgery and obstetrics and gynæcology Either group may be taken first at the option of the candidate, or the groups may be taken together Only candidates who show a competent knowledge of all the subjects comprising a group are passed There is no separate examination held for honours but the names of successful candidates are divided into an honours list and a pass list and a university medal may be awarded the candidate who has most distinguished himself in the whole examination

THE HIGHER DEGREES

M D —An examination for the M D is held twice yearly —in December and July Every candidate must have passed the examination for the M B B S , unless he became M B before May 1, 1904 He may present himself for examination in any one of the following branches (1) medicine (2) pathology, (3) mental diseases and psychology (4) midwifery and diseases of women (5) State medicine (6) tropical medicine, and if he wishes may pass also in another branch at a subsequent examination

The period that must elapse between acquiring the M B and sitting for the M D in any branch varies between one and two years according to the nature of the candidate's previous work and in all cases evidence must be afforded of special study of the subject chosen both written and practical examinations must be passed though exemptions can be obtained from the former in exceptional circumstances In each branch the scheme of examination is the same two papers on its special subject, a paper on an allied subject—for example medicine in the case of branch (4) pathology in branch (1)—an essay on one of two suggested topics connected with the special subject and a clinical or other practical test In any branch of the M D Examination a gold medal of the value of £20 may be awarded

M S —The regulations with regard to the Mastership in Surgery are of a corresponding kind, but there are four branches in which it may be obtained—general surgery, dental surgery ophthalmology, and laryngology, otology, and rhinology

FEES

For Matriculation 25 guineas for each entry First Examination 6 guineas for each entry to the whole examination For re examination in one subject the fee is 2 guineas Second Examination Part I 3 guineas for the first and each subsequent entry Second Examination Part II 9 guineas for each entry to the whole examination For re examination in one subject the fee is 4 guineas M B B S Examination 12 guineas for each entry to the whole examination and 6 guineas for examination or re examination in either group M D and M S Examinations 20 guineas and 10 guineas on re examination

Inquiries should be addressed to the Academic Registrar, the University of London South Kensington S W 7

UNIVERSITY OF BIRMINGHAM

This university confers medical and surgical degrees—namely, M B Ch B , M D , and Ch M —and also diplomas and degrees in State medicine and dentistry The M B , Ch B candidate may also combine with the earlier part of his medical curriculum courses leading to the ordinary B Sc degree in anatomy and physiology The degree of B Sc with honours in one of these subjects requires an extra year The full course of study for the degrees of M B , Ch B extends over six years The Senate has power to accept courses of study and examinations passed at other recognized universities as exempting from the examinations in physics, chemistry, biology, and organic chemistry In the case of such students at least three years must be spent in attendance upon classes at the university A degree of Ph D is also conferred for research study in medicine under special regulations Candidates must be graduates in medicine of a recognized university

Students entering the Medical Faculty for the M B , Ch B degrees must have passed—

(1) Either (*a*) the matriculation examination of the Joint Board of the Universities of Manchester Liverpool Leeds, Sheffield and Birmingham or (*b*) some other examination recognized as equivalent to the matriculation Candidates for medical degrees are required to have passed in English literature and mathematics, and are recommended to take Latin and a science subject—chemistry or physics —at the matriculation examination The matriculation examination of the Joint Board is held in July and September The regulations and the list of examinations accepted in lieu thereof will be sent on application to the Secretary to the Board Joint Matriculation Board, 315, Oxford Road, Manchester

(2) A recognized pre registration examination in the subjects of chemistry physics and biology—for example, the higher school certificate of the Joint Matriculation Board or a candidate may attend first year courses in the university October to June (chemistry, physics, and biology)—that is, First M B , Ch B , Parts I and II

PROFESSIONAL EXAMINATIONS

The candidate for the M B , Ch B degrees has five examinations to pass, subsequent to passing the First M B Ch B Examination or exemption therefrom In the Second (Part II) and Final examinations the candidate *must pass in all the prescribed subjects or undergo the* whole examination again

The First M B deals with physics, chemistry, and biology The Second M B (Part I) deals with organic chemistry The Second M B (Part II) deals with anatomy and physiology, and the student must pass in both simultaneously The Third M B deals with pathology and bacteriology The Fourth M B takes place at the end of the fifth year, the subjects being forensic medicine, toxicology, public health, materia medica pharmacology, and therapeutics

Final M B —This comprises medicine, surgery midwifery and diseases of women ophthalmology and mental diseases The candidate in addition to more ordinary certificates, must be prepared with a certificate of having acted as a post mortem clerk for three months and received special instruction in anæsthetics and clinical instruction in diseases peculiar to women asylum ward work, ophthalmology children's diseases venereal diseases ear and throat and skin diseases etc In respect to ophthalmology he must show that he has learnt refraction work He also has to present to the examiners at the time of his examination a short written commentary on a gynæcological subject or case investigated during the period of gynæcological clerking

M D —An ordinary candidate for this degree must be a M B Ch B of not less than one year's standing He presents an original thesis for approval, and then pas-

a general examination in the principles and practice of medicine. From the latter the Board of Examiners may exempt a candidate whose thesis is of exceptional merit. The regulations respecting the Ch.M. are of the same general character. Subject to certain requirements as to special research or other post-graduate study, graduates of other universities may obtain the M.D. and Ch.M. in the same way as holders of the Birmingham M.B., Ch.B.

FEES

The fee for Matriculation is £2 (payable to the Joint Matriculation Board); £2 10s. for First M.B. Examination (if taken in university), and £2 10s. for each of the first four Professional Examinations; M.B., Ch.B. degree fee, £10; M.D. and Ch.M. Examinations, £12 10s. each. For further particulars application should be made to the Dean of the Medical Faculty, University of Birmingham.

UNIVERSITY OF BRISTOL

In the Faculty of Medicine the following degrees are conferred: Bachelor of Medicine and Bachelor of Surgery (M.B. and Ch.B.), Doctor of Medicine (M.D.), Master of Surgery (Ch.M.), Bachelor of Dental Surgery (B.D.S.), and Master of Dental Surgery (M.D.S.). There are also the following diplomas: diploma in public health (D.P.H.), diploma in dental surgery (L.D.S.), and diploma in veterinary State medicine. All candidates for degrees in medicine, surgery, and dentistry are required to reach matriculation standard in the school certificate examination, or to pass such examination as may be regarded as equivalent by the Senate. All courses, degrees, and diplomas are open to men and women alike.

Conjoined Degrees of Bachelor of Medicine and Bachelor of Surgery.—Candidates must be not less than 21 years of age and have pursued the courses prescribed by university regulations during not less than five years after passing the First Examination in chemistry and physics, of which three shall have been spent in the university, and two of these three subsequent to passing the Second Examination. All candidates for the degrees of M.B., Ch.B. are required to satisfy the examiners in the several subjects of three examinations.

The First Examination.—The subjects of examination are: chemistry (inorganic), physics, and biology, the courses pursued being those for the time being approved for the intermediate part of the B.Sc. curriculum. This part of the curriculum shall extend over one year. (Candidates who have passed the higher school certificate approved by the Board of Education in these subjects will not be required to sit for the First Examination and will be regarded as having completed one year of study.)

The Second Examination.—The subjects of examination are: organic chemistry and elementary anatomy (Part I) and advanced anatomy and physiology (Part II).

The Final Examination.—The subjects of examination are: materia medica and pharmacy, pharmacology and therapeutics, general pathology, morbid anatomy, and bacteriology (Part I); special pathology, forensic medicine, toxicology, and public health, obstetrics (including diseases of women), surgery (systematic, clinical, practical, and operative, including ophthalmology and oto-rhino-laryngology), medicine (systematic, clinical, and practical, including mental diseases) (Part II). The subjects included in Part II may be taken in two groups—namely, Group I: surgery and obstetrics; Group II: medicine, public health, special pathology, forensic medicine, and toxicology. Candidates may pass Parts I and II together or separately, and the two groups of Part II may likewise be taken together or separately, but no student can obtain honours who elects to take the two groups of Part II separately. Forensic medicine and toxicology may be taken either with Part I or with Group II of Part II.

Degree of Doctor of Medicine.—Candidates must be Bachelors of the university of not less than two years' standing as such, and may elect either (1) to pass an examination in general medicine, or (2) to pass an examination in State medicine, or (3) to present a dissertation. The candidate who elects to pass the examination in State medicine must hold a diploma in public health of some university or college, and the candidate who elects to present a dissertation may be examined in the subject thereof.

Degree of Master of Surgery.—The degree may be taken in general surgery or in special subjects. Candidates shall be Bachelors of not less than two years' standing as such. For general surgery, they shall pass an examination in surgical anatomy, pathology, and bacteriology, and in operative, clinical, and general surgery, and shall present a dissertation. For special subjects—that is, ophthalmology or oto-rhino-laryngology or gynaecology—they shall, in addition to having studied and practised for two years the subject concerned, have held an approved appointment in it for not less than six months; they shall pass a written, oral, and clinical examination in the branch of surgery concerned, as well as in the anatomy, physiology, and pathology of the region of the body concerned (including, in the case of ophthalmology, physiological optics), and also a written examination in the principles of general surgery.

Diploma in Public Health.—Candidates must be at least 23 years of age, be fully registered medical practitioners of not less than two years' standing as such, and have passed the examination prescribed by regulation. The examination is divided into two parts.

UNIVERSITY OF DURHAM

To its own undergraduates, who may be of either sex, this university grants the degrees of Bachelor of Medicine and Bachelor of Surgery (M.B., B.S.), and Doctor of Medicine (M.D.), Master of Surgery and Doctor of Surgery (M.S. and D.Ch.), Bachelor of Hygiene, Doctor of Hygiene, and Bachelor of Dental Surgery and Master of Dental Surgery (B.D.S. and M.D.S.); it also grants diplomas in public health, psychiatry, and dental surgery. The university accepts the Durham University school certificate examination (if a sufficient standard is obtained in certain specified subjects) for matriculation purposes, but also accepts the tests of a considerable number of other educational bodies as a full or partial equivalent. A list may be obtained on application. In addition to satisfying the matriculation requirements of the university, every student must (1) pass a pre-registration examination in physics and inorganic chemistry conducted or recognized by the university, and (2) be registered on the books of the General Medical Council. To become a graduate, however, at the university it is not necessary to pass the major portion of the five years' curriculum within its precincts. It is sufficient if, before he presents himself for his final examination, the candidate has spent at least one year in study at the University of Durham College of Medicine, Newcastle-on-Tyne, including the practice of the Royal Victoria Infirmary in the same city. The earlier examinations may be passed while the student works elsewhere.

PROFESSIONAL EXAMINATIONS

There are four professional examinations for the M.B., B.S. degrees. The First, Second, and Third examinations are held in March and June, and the Final Examination in June and December. The first deals with biology and organic chemistry; the second with anatomy and physiology; the third with pathology, bacteriology, materia medica, pharmacology and pharmacy, medical jurisprudence, and public health. At the Final M.B., B.S. the candidate is examined in medicine, including therapeutics, and clinical medicine; surgery and clinical surgery; midwifery and diseases of women and children; clinical and practical midwifery and gynaecology; and clinically in psychological medicine, diseases of the throat, nose and ear, diseases of the skin, diseases of the eye, and diseases of children.

M.D.—A Bachelor of Medicine who wishes to proceed to this higher degree must be of at least two years' standing, and must comply with the regulations printed in the Calendar of the College of Medicine. If the candidate is not an M.B. of the university, he must be a practitioner of fifteen years' standing, 40 years of age, and submit to special tests. (See under Degrees for Practitioners, p. 474.)

M.S.—Candidates for this degree must have been engaged in practice for at least two years subsequent to becoming M.B., B.S.Durham. The subjects of the examination are surgery, systematic and clinical, surgical anatomy and pathology, and surgical operations.

D.Ch.—The university grants also the degree of Doctor of Surgery. Candidates for this degree must be registered medical practitioners, not less than 24 years of age. They must devote three years, subsequent to obtaining a registrable qualification, to the study of surgery and ancillary subjects; one at least of the three years must be spent in the university. The candidate must submit to the professor of surgery the course of study he proposes to follow, and this course must be approved by the Board of Faculty of Medicine.

One year must be devoted mainly to work in the departments of anatomy, physiology, pathology, and bacteriology, and the candidate must submit evidence of having so worked. Not less than six months of another year must be spent as a resident surgeon in a recognized teaching hospital, and the rest of the year in the study of surgery in a recognized medical centre. Not less than six months of one of the three years must be spent in surgical study abroad.

Degree of Bachelor of Hygiene and the D P H

No candidate is admitted to the final examination for the degree of B Hy. unless he is a Bachelor of Medicine and Surgery, of not less than two years' standing, of a recognized university whose degrees are registrable on the books of the General Medical Council of the United Kingdom.

No candidate is admitted to the final examination for the D P.H. unless he is a registered medical practitioner of not less than two years' standing

The course of study for the B.Hy and D P H extends over a period of not less than twelve calendar months subsequent to the attainment of a qualification registrable by the General Medical Council of the United Kingdom Candidates for the B Hy. must attend this course at the University of Durham; candidates for the D P H may attend it at the University of Durham or at any medical school or institution which is recognized by the university.

The examination for the diploma or degree consists of Part I and Part II, each of which extends over not less than two days, and is conducted by examiners specially qualified A candidate must pass in all the subjects of Part I before being admitted to examination for Part II In Part I, and also in Part II, a candidate must pass in all the specified subjects at one time.

The examination for Part I is practical, written, and oral, and includes the following subjects bacteriology and parasitology (including medical entomology); chemistry and physics; and meteorology and climatology, in relation to public health. Candidates are not admitted to examination for Part I until after they have completed the prescribed courses of instruction in the subjects thereof

The examination for Part II includes the following subjects: hygiene and sanitation (including sanitary construction), epidemiology and infectious diseases, sanitary law and vital statistics, public health administration The examination is written and oral, and includes practical examinations in infectious diseases, food inspection, inspection of premises—dwellings, factories, workshops, schools, etc Candidates are not admitted to examination for Part II until after they have completed the prescribed courses of instruction in the subjects thereof

Doctor of Hygiene

Candidates for the degree of Doctor of Hygiene must be Bachelors of Hygiene of the university of two years' standing, and are required to satisfy the examiners that they have conducted original research in the subject of public health.

Diploma in Psychiatry.

Candidates must be registered medical practitioners, and, unless qualified before January 1st, 1911, must have attended, subsequent to passing their qualifying examinations, courses of instruction in (*a*) anatomy; (*b*) physiology, (*c*) pathology; (*d*) bacteriology, (*e*) psychology and experimental psychology; (*f*) clinical neurology, (*g*) psychiatry; (*h*) clinical psychiatry. The examination consists of two parts, namely: (1) anatomy, physiology, pathology, and bacteriology, (2) psychology and experimental psychology, neurology, and psychiatry (systematic and clinical), and candidates may present themselves for the whole examination or for either part separately.

Licence and Degrees in Dental Surgery

L D S—Every dental student must, at the commencement of his studentship, be registered in the manner and under the conditions prescribed for medical students.

The First Examination consists of two parts, which may be passed separately: Part 1, biology; Part 2, theoretical dental mechanics, dental metallurgy (theoretical and practical). Second Examination: Anatomy, physiology (including biochemistry and biophysics), dental anatomy, and dental histology. Third Examination: Pathology and bacteriology, practical dental mechanics, dental materia medica and therapeutics. Final Examination: Medicine, surgery, dental surgery and pathology, orthodontics, operative dental surgery and dental prosthetics, and anaesthetics.

A candidate before presenting himself for examination is required to furnish certificates of instruction in the required subjects, attended after registration as a dental student at recognized colleges or medical schools.

Degree of Bachelor of Dental Surgery—1—Students taking their complete course of instruction in the university must pass the same matriculation tests as medical students, and the same pre-registration examination in inorganic chemistry and physics After registration students must spend five years in the university They must be in attendance in the dental department of the University of Durham College of Medicine for not less than two and a half years, six months of this time must be devoted to the study of the higher branches of dental science There are four examinations. The subjects of the examinations are as follows *First* Biology, organic chemistry, and dental mechanics and metallurgy. *Second* Anatomy, physiology, dental anatomy, and histology. *Third* Pathology and bacteriology, dental materia medica and therapeutics, and practical and dental mechanics *Final*: Medicine, surgery, dental surgery and pathology, orthodontics and operative dental surgery. In this subject knowledge of a much higher standard, and more advanced practical work, are required than for the Licence in Dental Surgery.

2—Candidates possessing a Licence in Dental Surgery of a British university must study for at least one year in the university. During such year they must spend at least six months in the Newcastle-upon-Tyne Dental Hospital in the study and practice of the higher branches of dental science. They must also pass all the professional examinations for the degree of Bachelor of Dental Surgery

Degree of Master of Dental Surgery—Every candidate for this degree must be a Bachelor of Dental Surgery of the university of not less than two years' standing, and present an essay embodying original work and research in some subject connected with dentistry He must also perform to the satisfaction of the examiners a piece of special dental work demanding a high degree of skill and experience.

The examinations are held concurrently with the medical examinations

The practical examinations in dentistry are conducted at the new Dental Hospital affiliated with the College.

FEES

The following fees are payable: Matriculation, £2; Examinations, Pre-registration, £3 3s; First, Second, and Third M.B., B S., each £5; Final M.B., B S, £15; M.D. and M.S., each £5; B.Hy., D.P.H., and D.Psy., each £10 10s., and D.Hy and D.Ch., each £20; First, Second, and Third L D S., each £3 10s., and Final L.D.S. £5; First, Second, and Third B.D S, each £5, Final B.D.S. £8; and M.D.S. £5. For degrees and *diplomas*: M.B., B.S., B Hy., and B.D.S., each £6 6s *plus* the sum of 10s. if it is the initial degree taken in the university, M.S. and M.D.S., each £6 6s.; M.D., D Ch, and D.Hy, each £10; D.P.H., D.Psy., and L.D.S., each £3.

Further information may be obtained from the Dean of the College, University of Durham College of Medicine, Newcastle-on-Tyne.

UNIVERSITY OF LEEDS

The degrees granted in the Medical Faculty of this university are Bachelor of Medicine, Bachelor of Surgery (M B and Ch.B.), and Bachelor of Dental Surgery (B Ch D), Doctor of Medicine (M D), Master of Surgery (Ch M), and Master of Dental Surgery (M Ch D) It also gives diplomas in public health, in psychological medicine, in dental surgery, and in nursing

Candidates for the M B must have attended courses of instruction approved by the university for not less than five years, two at least of such years having been passed in the university, at least one year being subsequent to

the date of passing the first examination They must also have matriculated by satisfying the examiners in

I *Either* English Composition and English Literature, or English Composition and History
II *Either* Mathematics *or* Latin
III, IV, V *Three* other subjects not already taken under I and II above, chosen from the following list

(1) English literature, (2) History, (3) Geography, (4) Greek (5) Latin, (6) French, (7) German, (8) Some one other language approved by the Board, (9) Mathematics, (10) Mechanics (11) Physics, (12) Chemistry, (13) General experimental science (14) Natural history (15) Botany

Provided that (*a*) candidates who take Mathematics under II above must include one of the subjects 4—8, (*b*) candidates who take Latin under II above must include one of the subjects 9—15 In all cases Mathematics is a compulsory subject for admission to the Faculty of Medicine

Exemption from the examination may be granted to applicants holding certificates of having passed examinations of a standard deemed by the Matriculation Board to be at least equal to the Board's examination

PROFESSIONAL EXAMINATIONS

The examinations for the M B, Ch B number three The first deals with (1) physics and inorganic chemistry, (2) biology, (3) organic chemistry In each subject laboratory work is included, but the two parts can be taken separately For neither can the candidate present himself until after matriculation and a period of approved work in the respective subjects

The Second Examination —The Second Examination consists of Part I, materia medica and practical pharmacy, Part II, anatomy and physiology Candidates will be allowed to pass any parts separately

The Final Examination —The Final Examination consists of Part I, pharmacology and pathology and bacteriology, Part II, medicine, surgery, obstetrics, gynaecology, and clinical pathology, Part III, forensic medicine, public health, and therapeutics Part I may be taken at the end of the second clinical year, and must be passed before Parts II and III are taken Parts II and III may be taken at the end of the third clinical year but not before the completion of the fifth year of medical study If taken separately Part II must be passed before Part III

M D —Candidates for this degree must be bachelors of medicine and bachelors of surgery of the university, and subsequently to having graduated must have completed two years of hospital practice or special study approved by the university, or four years in the practice of their profession in one or other of its various branches, six months hospital practice or special study to count as the equivalent of one year's ordinary practice Any subject of the medical curriculum except surgery may be chosen for the examination, but a thesis, the title of which must previously receive the approval of the Board of the Faculty of Medicine, may be submitted, and if it is adjudged to be of exceptional merit the candidate may be exempted from further examination

Ch M —The candidate for this degree must have been admitted to the M B, Ch B of the university not less than a year previously, and during that time must have held for at least six months a surgical appointment in a public institution affording full opportunity for the study of practical surgery He must also have attended certain courses, including one on ophthalmology and one on pathology and bacteriology, he is then examined in surgery in all its branches and in ophthalmology and pathology and bacteriology

FEES

The Matriculation fee is £2 and on readmission £1 10s For each of the other examinations £6 and £6 on readmission, Ch M £10 and same on readmission M D £10 On conferment of the degree of Ch M £5 is payable and £5 for the M D degree

UNIVERSITY OF LIVERPOOL

This university, besides granting degrees in medicine (M B and M D) and in surgery (Ch B, M Ch Orth, and Ch M), gives degrees in dental surgery (B D S and M D S), a degree in hygiene (M H), and degrees in veterinary science (B V Sc, M V Sc, and D V S Diplomas are awarded in dental surgery (L D S), tropical medicine (D T M), tropical hygiene (D T H), public health (D.P H), veterinary hygiene (D V H), and radiology and electrology (D M R E) The degree Doctor of Philosophy (Ph D) may also be taken in the Faculty of Medicine

MATRICULATION

The matriculation examination is governed by the Joint Matriculation Board, 315, Oxford Road, Manchester, which accepts, under certain conditions, the tests of several bodies as its equivalent Candidates will be required to have included mathematics among the subjects in which they have passed at such examination

PROFESSIONAL EXAMINATIONS

Candidates for the M B, Ch B degrees have three examinations to pass, the first including (1) chemistry, (2) biology (zoology and botany), (3) physics, (4) special chemistry

Second M B —This test covers (1) anatomy, (2) physiology, including physiological chemistry and histology

Final M B —The subjects of the Final Examination are Part I—(*a*) pathology, (*b*) pharmacology and general therapeutics Part II—(*a*) forensic medicine and toxicology, (*b*) public health Part III—(*a*) obstetrics and diseases of women, (*b*) surgery, systematic, clinical operative and practical, including ophthalmology, (*c*) medicine systematic and clinical, including therapeutics, infectious diseases, and diseases of children Candidates may take Parts I, II, and III separately, provided that candidates may not present themselves for Part III until they have completed the sixth year of medical study

M D —May be conferred on graduates (M B, Ch B Liverpool) (*a*) on candidates of two years' standing who present a thesis acceptable to the Faculty, and certified to be the candidate's own work, together with, if candidate desires, copies of published original papers upon medical science—oral examination on subject of thesis (*b*) on candidates of five years' standing by examination

Ch.M —May be conferred on graduates (M B, Ch B Liverpool) after examination Other information concerning the diplomas of this university and its medical school will be found on page 446

FELLOWSHIPS, SCHOLARSHIPS, AND EXHIBITIONS

The university awards Fellowships annually to students of distinguished merit, as follows

(1) John Rankin Fellowships in Anatomy, two each of the value of £120, tenable for two years (2) Ethel Boyce Fellowship in Gynaecology, value £100 and tenable for one year open to fully qualified medical students of either sex (3) John W Garrett International Fellowship in Bacteriology value £100 and tenable for one year (4) Robert Gee Fellowship in Human Anatomy, value £100 and tenable for one year (5) Holt Fellowships in Physiology and Pathology, two in number, value £150 each and tenable for one year (6) Johnston Colonial Fellowship in Biochemistry, value £150 and tenable for one year (7) Thelwall Thomas Fellowship in Surgical Pathology value £200 and tenable for one year (8) Lady Jones Fellowship in Orthopaedic Surgery, one of £200 offered every two years

There are in addition, scholarships and exhibitions for medical students

VICTORIA UNIVERSITY OF MANCHESTER

This university grants the four ordinary degrees in medicine and surgery—M B and Ch B and M D and Ch M, a degree and diploma in dental surgery, a diploma in public health, a certificate in factory and in school hygiene, a diploma in psychological medicine, a diploma in bacteriology, and a diploma in pathology Candidates for degrees must pass the special matriculation examination prescribed by the Faculty of Medicine (or some equivalent examination accepted in lieu thereof, see the prospectus of the Joint Matriculation Board), and complete at the university itself for at least two years of the five years' curriculum, subsequent to the passing of the First M B Examination The matriculation examination comprises (1) Latin, (2) mathematics, (3) the English lan-

its literature and history, (4) mechanics, (5) one subject at choice as approved by the Joint Board It is held in July and September

PROFESSIONAL EXAMINATIONS

M B, Ch B.—There are four examinations for this degree They must be passed in proper order, and before admission to them the candidate must be duly certified as having attended in the subjects involved The First M B is divided into Part I chemistry and physics, Part II, biology—(*a*) botany, (*b*) zoology The parts may be taken separately or together At the Second M B the candidate is examined in anatomy (including histology) and physiology, at the third in pathology, bacteriology, and pharmacology (including materia medica and practical pharmacy) The Final Examination, under new regulations, is divided into two parts which may be taken separately Part I consists of (*a*) forensic medicine and toxicology, and (*b*) hygiene and preventive medicine Part II consists of (*a*) medicine, including dermatology, diseases of children, and mental diseases, (*b*) surgery, surgical pathology, and diseases of the eye and of the ear, nose, and throat, (*c*) obstetrics and gynaecology

M D.—A candidate for this degree must be a Bachelor of Medicine of the university of at least one year's standing He has a choice between presenting an original dissertation or undergoing a written (as well as practical and clinical) examination in medicine and a written and practical examination in pathology, and one other subject selected by himself

Ch M.—A candidate must have held, since becoming Ch B, and for not less than twelve months, a post in a public institution affording opportunity for the study of the branch of surgery in which examination is desired The examination in Branch I comprises the general field of surgery, Branch II obstetrics and gynaecology, Branch III, ophthalmology, Branch IV, otology, laryngology and rhinology

B Sc and M Sc.—The ordinary degree of B Sc in the Schools of Anatomy and Physiology may be obtained by students in medicine who in their third year of study for the degree of M B, Ch B complete the additional courses in these subjects prescribed for this degree Candidates for the Honours degree of B Sc in anatomy or physiology who are students in medicine are required to attend courses in advanced anatomy and physiology for four terms after passing the Second Examination for the degrees of M B, Ch B Graduates in science of this university of not less than one year's standing from the date of their graduation as Bachelors, may proceed to the degree of M Sc by the presentation of an approved thesis on some subject coming within the scope of the Faculty of Science

FEES

The following examination fees are payable Matriculation £2 on readmission £2 Each M B examination £8 8s on readmission £3 3s M D including the conferring of the degree £15 15s Ch M £10 for the examination and £10 10s for conferment of degree Application for further information should be addressed to the Dean of the Medical School

UNIVERSITY OF SHEFFIELD

The degrees of this university (M B, Ch B, M D and Ch M, B D S and M D S) and the diploma of licentiate in dental surgery are open to candidates of either sex Candidates for a degree must have matriculated in the university or have passed such other examination as may be recognized for this purpose and have passed the further examination in chemistry and physics

PROFESSIONAL EXAMINATIONS

A candidate for the degrees of M B Ch B must produce certificates that he will have attained the age of 22 years by the day of graduation that he has pursued the courses of study required by the university regulations during not less than five and a half years subsequent to the date of his matriculation or exemption from matriculation three of such years at least having been passed in the university, one at least being subsequent to the passing of the Second Examination The following examinations must be passed in due order

First Examination.—The subjects are chemistry, physics, and biology Candidates who have passed the Intermediate Examination of the Faculty of Pure Science in any or all of the subjects of the First M B Examination will, on payment of the fee for the latter examination, be deemed to have passed it when they have passed in such subjects as they did not take for the Intermediate B Sc Examination Candidates on presenting themselves for this examination are required to furnish certificates of having attended for not less than one year approved courses of instruction, after matriculation, in (i) chemistry, inorganic and organic (ii) physics, (iii) biology, and of having passed or obtained exemption from the preliminary examination in chemistry and physics

Second Examination.—The subjects are anatomy and physiology (Part I) The candidate must have passed the First Examination, and must have attended (1) courses on anatomy, including lectures and practical anatomy, during five terms, (2) courses on physiology, including lectures and practical physiology, during one year

Third Examination.—The subjects are pathology and pharmacology, applied anatomy, and physiology Candidates must have attended courses of instruction in pathology for five terms in pharmacology for four terms (and one term in pharmacy), in applied anatomy for four terms, and in physiology (Part II) for six terms

Final Examination.—The subjects are Part I, forensic medicine and public health candidates must have attended courses for one term in each subject Part II, medicine (including mental diseases and diseases of children and vaccination), special pathology (including morbid anatomy and clinical pathology), and therapeutics Part III, surgery (including the administration of anaesthetics, diseases of the ear, nose, and throat, ophthalmology, and surgical pathology), and obstetrics and gynaecology (including ante natal and post natal practice and infant hygiene) Candidates for Parts II and III must have completed a minimum of five and a half years of study

M D.—Candidates for the degree of Doctor of Medicine must have passed the examination for the degrees of M B, Ch B at least three years previously must present a thesis embodying observations in some subject approved by the Professor of Medicine and must pass an examination in the principles and practice of medicine

Ch M.—Candidates for the degree of Master of Surgery must have passed the examination for the degrees of M B, Ch B at least three years previously, and must, since taking the degrees of M B, Ch B, have held for not less than twelve months a surgical appointment in a public hospital or other public institution affording full opportunity for the study of practical surgery The subjects of examination are systematic, clinical, and operative surgery, surgical anatomy, surgical pathology, and bacteriology

Other information concerning this university will be found in the section devoted to Provincial Medical Schools

UNIVERSITY OF WALES

The Charter and statutes of the University of Wales provide *inter alia* for a School and a Faculty of Medicine and for the granting of the following degrees Bachelor in Medicine (M B), Bachelor in Surgery (B Ch) Master in Surgery (M Ch), and Doctor in Medicine (M D)

A candidate for the M B, B Ch is required to pursue a course of study of not less than six academic years subsequent to matriculation in the university and of these years at least three must have been passed in one of the constituent colleges of the university These are the University College of Wales Aberystwyth University College of North Wales Bangor University College of South Wales and Monmouthshire Cardiff and University College of Swansea He must also hold an arts or science degree of the University of Wales or of some other university approved for this purpose Certain of the courses of study pursued for a B Sc or a B A degree may be counted as courses required for the degrees in the Medical Faculty

The courses for the M B B Ch are divided into two sections of which the first includes the preliminary subjects—physics chemistry, botany, zoology, and the

ancillary subjects—organic chemistry, human anatomy, and physiology. Study of the preliminary subjects and of organic chemistry must extend over at least one academic year; study of physiology and anatomy must extend over at least two academic years; the first section of the course must occupy not less than three years. The second section includes courses in pathology, bacteriology, pharmacology, hygiene and forensic medicine, medicine, surgery, and obstetrics and gynaecology, and cannot be commenced, except in the case of pharmacology, until the examinations relating to the preliminary and ancillary courses have been passed. Examinations in all the subjects are held in June of each year, and in medicine, surgery, obstetrics, and gynaecology in December also.

The university also offers courses of study in public health and in tuberculosis. Candidates for the diploma in public health (D.P.H.) and for the tuberculous diseases diploma (T.D.D.) must possess a medical qualification registrable for practice in Great Britain and Ireland, and must have completed courses of study as prescribed by the regulations either at the Welsh National School of Medicine, Cardiff, or at another institution approved by the university.

WELSH NATIONAL SCHOOL OF MEDICINE

This school has been reconstituted under the provisions of a Royal Charter granted to the school in February, 1931. The school maintains departments of medicine, surgery, obstetrics and gynaecology, pathology and bacteriology, materia medica and pharmacology, tuberculosis, and preventive medicine.

Full particulars of the conditions of admission to the school and the courses of instruction provided may be obtained on application to the secretary, Welsh National School of Medicine, The Parade, Cardiff.

English Medical Corporations

There are in England three medical corporations which grant licences to practise—the Royal College of Physicians of London, the Royal College of Surgeons of England, and the Society of Apothecaries of London. The first two combine for certain purposes to form what is known as the Conjoint Board in England. Details concerning this body, its component Colleges, and the third licensing body here follow.

THE CONJOINT BOARD

This body—the Examining Board in England—deals with the qualifications of all candidates for the Licence of the Royal College of Physicians of London and for the Membership of the Royal College of Surgeons of England. It prescribes for them certain periods of study, and recommends those who pass the required examinations for the Licence and for the diploma of Member respectively. The successful candidate is then entitled to register as L.R.C.P.Lond., M.R.C.S.Eng. It performs the same task in connexion with diplomas in public health, tropical diseases, ophthalmic medicine and surgery, psychological medicine, laryngology and otology, and gynaecology and obstetrics—jointly issued by the two Colleges in question. Under the present regulations every candidate for the L.R.C.P. and M.R.C.S. must (1) complete five years of professional study after passing a recognized preliminary examination and a recognized pre-medical examination in chemistry and physics; (2) comply with the regulations, which may be had from the Secretary, Examination Hall, Queen Square, London, W.C.1; and (3) pass the two professional examinations of which particulars appear below. The old regulations for the Conjoint diploma, of which an account was given in the Educational Number of the *British Medical Journal* for 1922, still apply to students who passed their preliminary examination in general education before January 1st, 1923.

PRESENT REGULATIONS FOR THE CONJOINT DIPLOMAS

The following is an outline of the present regulations for the L.R.C.P.Lond. and M.R.C.S.Eng. The full regulations and synopses and forms of certificate may be obtained from the Secretary.

PRE-MEDICAL EXAMINATION

Students are required to pass a pre-medical examination in chemistry, physics, and elementary biology, conducted by the Conjoint Examining Board, before commencing the five years' curriculum of professional study, or some other examination recognized by the Board—namely, the examination in chemistry, physics, and biology for the degree in Medicine of any university recognized by the Board, the higher school certificates of Oxford and Cambridge Universities and the Oxford and Cambridge Schools Examination Board, the higher certificates of London, Bristol, Durham Universities, the Joint Matriculation Board of the Northern Universities, or the Central Welsh Board higher certificate.

A candidate must enter for chemistry and physics together, and he will not be allowed to pass in one without obtaining at the same time at least half the number of marks required to pass in the other subject. He will be admitted to the examination on producing evidence of having passed the required preliminary examination in general education.

The examination is partly written, partly oral, and partly practical. A candidate rejected in one or both subjects of the examination will not be admitted to re-examination until after the lapse of a period of not less than three months. Not more than two terms of professional study is recognized before the examination in elementary biology is passed.

PROFESSIONAL EXAMINATIONS

There are two professional examinations, called the First and Final Examinations. The courses of study for the First Examination may be commenced before the pre-medical examination in chemistry and physics or some equivalent examination has been passed provided three terms of study of anatomy and physiology are completed after passing such examination.

First Professional Examination.—The subjects of this are: Section I, (*a*) Anatomy, including histology and embryology; (*b*) physiology, including biochemistry. Section II, Pharmacology and materia medica. A candidate must have attended at a recognized Medical School courses of instruction in anatomy, including embryology, during five terms, in the course of which he must dissect the whole body; courses of instruction in physiology, including biochemistry and biophysics, during five terms; courses of instruction in pharmacology and materia medica. A candidate may present himself for the two sections together or separately, but he must take parts (*a*) and (*b*) of Section I together until he has passed in one or both parts, but a candidate will not be allowed to pass in one part unless he obtains at the same time at least half the number of marks required to pass in the other part. Section II of the examination may be passed at any time before the candidate enters for the Final Professional Examination, provided that the courses for admission to Section I have been completed. A candidate who produces satisfactory evidence of having passed an examination in the subjects of Section I or of either part of Section I and of Section II in the examination for the degree in Medicine conducted at a university recognized by the Board will be exempted from further examination in such subject or subjects.

Final Professional Examination.—The subjects of this are: Section I, Pathology (including morbid anatomy, morbid histology, and clinical pathology) and bacteriology. Section II, Part I, Medicine, including medical anatomy, forensic medicine, and public health; Part II, Surgery, including surgical anatomy and the use of surgical appliances; Part III, Midwifery and gynaecology. The examination is partly written, partly practical, partly clinical, and partly oral. A candidate may take Sections I and II and the three parts of Section II of the Final Examination separately, or may take the whole examination together. He will be required to produce the certificates prescribed by the regulations before being admitted to the respective parts of the examination. No exemption is granted from any subject in the Final Examination.

FEES

The fee for the *Pre-Medical Examination* is four guineas, for re-examination in Chemistry two guineas, for re-examination in Physics one guinea, and for *Biology one guinea*. The fee for the *First Professional Examination* is ten guineas, for re-examination after rejection in Section I six guineas, for re-examination after rejection in either part of Section I three guineas, for re-examination after rejection in Section II three

guineas The fee for admission to Section I of the *Final Professional Examination* is four guineas for admission to Section II Part I ten guineas, Part II ten guineas Part III six guineas and the re examination fees are respectively three guineas six guineas and five guineas

ROYAL COLLEGE OF PHYSICIANS OF LONDON

This College has three grades—its Licentiates, its Members, and its Fellows The Licence is now only issued through the Conjoint Board The Membership (examinations for which are held in January, April, July, and October) is only granted to those who have obtained the Licence, or to those who are registered practitioners and graduates of a recognized university, in any case they must be persons over 23 years of age Candidates are examined in pathology and the practice of physic, partly in writing and partly viva voce, they are also examined in Latin, Greek, French and German The languages are not compulsory, but credit is given to those who show a knowledge of them The fee for the Membership is £42 or in the case of a Licentiate £21 There is a fee of £10 10s, payable before entrance to the examination which in the case of successful candidates is reckoned as part of the Membership fee The body of Fellows is maintained by election from among the Members

ROYAL COLLEGE OF SURGEONS OF ENGLAND

This College has two grades—Members and Fellows The Members are admitted as stated in the section dealing with the Conjoint Board The Fellowship is granted after examination to persons at least 25 years of age who have been engaged in professional studies for six years There are two examinations for the Fellowship—the first in anatomy and physiology, held in the months of June and December, which may be passed after the third winter session, the second held in the months of May and November, chiefly directed to surgery, which may be passed after six years of professional study Candidates must pass the Final Examination of the Examining Board in England and be admitted Members of the College before admission to the Second Examination for the Fellowship, except in the case of graduates in medicine and surgery of not less than four years standing of universities recognized by the College for the purpose who are required to attend for one year the surgical practice of a general hospital recognized by the College after obtaining their degrees, which must be registrable in this country

Fees—At First Examination £8 8s for re examination £5 5s At Second Examination £12 12s Admission fee £10 10s for members £31 10s for non members

SOCIETY OF APOTHECARIES OF LONDON

This body confers a registrable diploma in medicine, surgery, and midwifery now known as the L M S S A (Licentiate in Medicine and Surgery of the Society of Apothecaries) on those successful at the following examinations

Pre medical Examination—Chemistry and physics, and elementary biology

Primary Examination—This includes anatomy, physiology and histology, and materia medica and pharmacy Candidates will be excused any or all the subjects of the Primary Examination on producing evidence that they have passed the equivalent examinations before an examining body recognized by the Society Candidates referred in anatomy will be required to produce evidence of further work in the dissecting room before being admitted to re examination

Final Examination—This is divided into four sections A Principles and practice of surgery, including surgical pathology, surgical anatomy, operative manipulation, instruments and appliances, B Principles and practice of medicine (including therapeutics, pharmacology, and prescriptions), bacteriology, pathology, and morbid histology, C, Midwifery gynæcology, diseases of new born children, obstetric instruments and appliances D Forensic medicine, hygiene, theory and practice of vaccination, and mental diseases A, B, C, and D may be taken at separate examinations, but there is no exemption from any subject of the Final Examination (A separate examination in pathology will be instituted during the current year)

The fee for the Pre Medical Examination is £5 5s, for the Primary and Final £21 The regulations and synopses relating to the several examinations and other information may be obtained from the Registrar Apothecaries' Hall Blackfriars L C 4

Mastery of Midwifery

The Society has recently instituted a Mastery of Midwifery, and issues a diploma under this title denoting the possession of specialized knowledge of ante natal care, midwifery, and child welfare The examinations take place in May and November, and candidates are required to submit certificates, etc fourteen days before date of examination It is intended to impose a severe test so as to ensure a high standard of professional knowledge but the diploma will not be registrable under the Medical Acts Admission is open to all who have been for not less than a year in possession of a registrable medical qualification, and who have had certain prescribed experience at recognized institutions concerned with obstetrics, ante natal work, and child welfare work Special conditions apply, until 1932, to practitioners of ten years standing Medical officers employed by a public health authority, and having special duties connected with maternity and child welfare, will be admitted to the examination on production of evidence to that effect The entrance fee for the examination is £10 10s, and a further fee of £10 10s is payable by successful candidates before admission to the Mastery Copies of the regulations may be obtained from the Registrar at the address given in the preceding paragraph.

Scotland

THE UNIVERSITIES

There are in Scotland four universities each possessing a Faculty of Medicine, and having the right to confer degrees which admit the holder to the *Medical Register*. In essential points the regulations in their medical faculties for undergraduates are much alike, so that a general account can be given of all of them together

The universities are those of Edinburgh, Glasgow, Aberdeen, and St Andrews The provision each of the cities in which these universities are situated makes for the education of medical students will be found in the section on Medical Schools in Scotland, here it need merely be said that degrees in medicine from Scotland as a whole have always enjoyed a high repute

The degrees granted in medicine and surgery to candidates of either sex are four in number—Bachelor of Medicine (M B), Bachelor of Surgery (Ch B), Doctor of Medicine (M D), Master of Surgery (Ch M) The two former are not obtainable one apart from the other Besides these degrees a diploma in tropical medicine and hygiene is obtainable from the University of Edinburgh, as also diplomas in psychiatry, public health and radiology As for public health, registrable degrees in this subject are granted by the University of Glasgow while diplomas in public health may be obtained from the Universities of St Andrews and Aberdeen

The conditions for admission of graduating students of medicine are the same as those in the Faculties of Arts or Science (for degrees in pure science) Prospective medical students are also required to pass a preregistration examination in chemistry and physics

PROFESSIONAL EDUCATION

The regulations comply in all respects with the requirements and recommendations of the General Medical Council, and, in addition, necessitate definite study for

stated periods of diseases of children, of the larynx, ear, and nose, of the skin, of ophthalmology, and of mental diseases. In respect of the various courses certificates must be obtained showing that the student has not only attended regularly, but has duly performed the work of the class. Out of the necessary five years of medical study, not less than two must be spent at the university whose degrees the student hopes to obtain, and the balance at any place officially recognized for such purpose. In each academic year there are two sessions—one lasting from the beginning of October to the middle of March, and the other from the middle of April to the beginning of July.

PROFESSIONAL EXAMINATIONS

The distinctive feature of the Scottish curriculum is that though nominally there are only four examinations, each of these may be, and habitually is, split up by the student into sections. Hence, a student may complete some stage of his career during the course of nearly every session. Thus, by the end of the first winter session the student may pass in zoology and chemistry. At the end of the first summer session he can finish with botany and physics, and with anatomy and physiology at the end of the second. Pathology and materia medica he will pass at the end of the third year, and so on, until the final examination in midwifery, surgery, and medicine, and the corresponding clinical subjects, at the end of the fifth year of study. At each examination the candidate may pass "with distinction," and a record is kept of the merit displayed, so that when the time comes for the candidate to graduate, one who has done well throughout can be declared as graduating with honours. A further point in the system is that the student's own teachers commonly take some part in his examination.

Of the four examinations, the first deals with physics, botany, zoology, and chemistry; the second with anatomy and physiology; the third with materia medica and pathology; the fourth with medicine and surgery (clinical and systematic), midwifery, clinical midwifery and clinical gynaecology, and forensic medicine and public health. The first three examinations are held three times a year; the final twice a year.

Exemption from the first professional examination can be obtained by candidates who have passed an arts, science, or medical degree examination in its subjects at any recognized university. When a candidate presents himself for an examination in several of its parts, but is not successful in all of them, he is credited at the next examination with those subjects in which he has already been approved.

THE HIGHER DEGREES

It is open to those who are already M.B., Ch.B. to proceed either to the M.D. or the Ch.M. A candidate for the former must have been engaged for not less than one year in work in the medical wards of a hospital, or in scientific research in a recognized laboratory, or in the Naval or Military Medical Service, or have been at least two years in general practice, and he must be 24 years of age. He has to write a thesis on any subject not exclusively surgical, and is examined in clinical medicine and in some one or other of its special departments. The regulations for candidates for the Ch.M. are of a corresponding character, a period of surgical work in a hospital elsewhere being substituted for medical work, and the thesis being on a surgical rather than a medical subject. He is examined in surgical anatomy, clinical surgery, operative surgery, and in some of the special departments of surgery.

FEES

It is estimated that the class, examination, and other fees for the M.B., Ch.B. come altogether to about £265, the separate examination fees included in this calculation being as follows:

	£	s.	d.
First Professional	9	9	0
Second Professional	7	7	0
Third Professional	6	6	0
Final	9	11	0

Re-entry in any subject in which the candidate has failed entails a fresh payment of £1 1s. Candidates for the M.D. and Ch.M. pay £21, and on re-entry £5 5s.

More detailed information with regard to the Universities of Edinburgh can be obtained from the *Medical Prospectus*, price 6d., which is published by Mr. Thin, 55, South Bridge, Edinburgh, or on application to the Dean of the Faculty of Medicine. Similar information about Glasgow should be sought from the Assistant Clerk, Matriculation Office, Glasgow. With regard to Aberdeen, application may be made to the Secretary of the Medical Faculty, Marischal College. In respect of St. Andrews, information can be obtained either from the Secretary of the University, or, alternatively, from the Secretary of the United College, St. Andrews, or the Secretary of University College, Dundee, these being the two constituent colleges of the University of St. Andrews.

Finally, it should be mentioned that in connexion with each of the Scottish universities there are valuable bursaries and scholarships, some information as to which will be found in the article on Medical Schools.

THE CARNEGIE TRUST

The following is a summary of the regulations made by the Carnegie Trust for the Universities of Scotland for assistance in the payment of class fees in the universities and extra-mural colleges of Scotland.

Applicants must be over 17 years of age; they must be of Scottish birth or extraction, or have attended for two years after the age of 14, at a school or institution under inspection of the Scottish Education Department. Applicants so qualified who have been pupils of schools under the Scottish Education Department will be eligible for assistance in the payment of class fees if they have obtained the leaving certificate of the Department, provided that it bears evidence of such preliminary education as is required by the universities for their graduating curricula, or that it has been supplemented by such passes either in the Scottish Universities Preliminary examination as will satisfy the above requirement of the universities. Where applicants have not been pupils of schools under the Scottish Education Department, or where other good ground for not having obtained the leaving certificate can be shown, the Executive Committee has power to accept instead what it deems equivalent evidence of attainments.

Applicants in the Faculties of Arts and Science must have had their course of study for each academic year approved by the University Adviser of Studies, and they must have passed the graduation examinations belonging to the previous stage of their curriculum before becoming eligible for assistance in the payment of fees of classes belonging to a further stage. Beneficiaries must submit to the Executive Committee at the end of each session particulars as to their attendance and work, any distinctions gained, and any graduation examinations passed.

The annual allowance towards payment of class fees offered to beneficiaries by the Trust in the Faculty of Medicine is £19 for four years, in all £76. Any unexpended part of a grant will be carried forward to the succeeding year. In combinations of Faculties the allowances available for beneficiaries are: Arts and Medicine—two Arts grants of £8 and two Medicine grants of £19, in all £92; Science and Medicine—two Science grants of £17 and four Medicine grants of £19, in all £110.

Applicants, in writing for application forms, must name the university and faculty in which they intend to study, and state whether they have previously obtained the benefits of the Trust. Applications must be lodged not later than October 25th for the winter session, or May 10th for the summer session. Payments are made by means of fee coupons and fees already paid are not refunded.

THE CORPORATIONS

There are three medical corporations in Scotland—the Royal College of Physicians of Edinburgh, the Royal College of Surgeons of Edinburgh, and the Royal Faculty of Physicians and Surgeons of Glasgow. Their licences can be separately obtained only by persons who are already in possession of a recognized qualification—in surgery in the case of the College of Physicians, and in medicine in the case of the College of Surgeons and the Faculty of Physicians and Surgeons of Glasgow. All others must submit to the examinations held by the Conjoint Board, which the three corporations have combined to form. Details concerning this Board and its component colleges follow. The conditions on which their higher qualifications are granted will be found set forth separately in connexion with each corporation.

THE CONJOINT BOARD IN SCOTLAND

This body has charge of all questions connected with candidates for the Conjoint Licences of the Royal College of Physicians of Edinburgh, the Royal College of Surgeons of Edinburgh, and the Royal Faculty of Physicians and Surgeons of Glasgow. Those finally approved by it are entitled to registration and to the initials denoting the Licences of the three bodies concerned—namely, L.R.C.P.Ed., L.R.C.S.Ed., and L.R.F.P.S.Glas. The Board requires all candidates to comply with the regulations of the General Medical Council. It has an arts examination of its own, but is prepared to accept in its place any of the other educational tests approved by the General Medical Council. All candidates must obtain registration with the General Medical Council.

Professional Curriculum for Candidates registered as Medical Students after October 1st, 1930

Subsequent to registration as a medical student the candidate must pass not less than five years in medical study, each comprising a winter and a summer session. The Board does not insist that candidates shall pursue their study at any particular place, and is prepared to accept certificates of having attended the necessary courses from any recognized medical school.

Its examinations are four in number, each of them being held four times every year, and these will fall to be held two times in Edinburgh and two times in Glasgow during the next period; it is open to candidates to present themselves for examination at either place. The first examination deals with general biology (systematic and practical), and physics and chemistry (systematic and practical); the second with anatomy, embryology, physiology, biochemistry and biophysics; the third with pathology (including bacteriology and morbid anatomy) and pharmacology (theoretical and practical); and the final with (1) medicine, including therapeutics, applied anatomy and physiology, and clinical pathology, with practical medicine; (2) surgery, including applied anatomy and physiology, clinical pathology, and practical surgery; (3) midwifery and diseases of women, clinical obstetrics and gynaecology, with practical midwifery; and (4) medical jurisprudence and public health. All candidates for the Final Examination must complete portions (1) (2) and (3), which must be taken together, within a period of nineteen months.

These examinations must be passed in due order, and before admission to any of them the candidate must supply certificates showing that he has completed the due periods of study of their subjects. He can present himself in any single subject of the first three examinations. As regards the Final Examination, a candidate can present himself in medical jurisprudence and hygiene at any time after completion of the third examination and of his study of these subjects; but in medicine, surgery, and midwifery he cannot present himself until the completion of five years' study, and he must take them all simultaneously. A candidate who takes up several subjects of an examination or the whole of the subjects at one time, but fails in some of them, is credited at the next examination with those subjects in which he has been approved.

Part or entire exemption from the first three examinations may be granted to those who have already passed before other bodies examinations deemed by the Board equivalent to its own, but all candidates for the Conjoint Licence must sit for the Final Examination, and at no examination can a candidate present himself within three months of his rejection by some other licensing body.

FEES

It is estimated that the total cost of lectures and fees for the Conjoint Licence is about £170. The separate examination fees are as follows: First, Second, and Third Professional, £5 each; Final £15. On re-entry for any of the first three examinations £3, and on re-entry for the Final, £5. If the re-entry is only in one or two subjects of the First, Second, or Third Examination the fees are smaller.

Information concerning this Board should be sought either from Mr. David Thomson, 49, George Square, Edinburgh, or from Mr. Walter Hurst, Faculty Hall, 242, St. Vincent Street, Glasgow.

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH

This College has three grades—Licentiateship, Membership, and Fellowship—all of which are open to men and women. The regulations applying to candidates for the Licentiateship have already been generally indicated. If desirous of receiving it apart from those of the other two corporations, they must be duly registered medical practitioners. Candidates will be required to pass an examination corresponding to the medical part of the Final Examination of the Conjoint Board, and conditioned in the same way, and also an examination in materia medica. The fee for examination is 15 guineas, a special examination being obtainable on due cause being shown, and on payment of 5 guineas extra. Ordinary examinations take place monthly on the first Wednesday and Thursday, except in September and October.

Candidates for the Membership must be either Licentiates of a British or Irish College of Physicians, or alternatively graduates of medicine of a university approved by the Council, and in either case not less than 24 years of age. Candidates are examined in medicine and therapeutics, also on one or more departments of medicine specially professed, and approved by the Council, in which a high standard of proficiency will be expected. The fee to be paid by a candidate for the Membership is £36 15s. The examination is held quarterly, on the second Tuesday and following days of the months of January, April, July, and October, and application for admission to it must be made a month previous to the date at which it is proposed to appear.

For the Fellowship the candidate must have been a Member of the College for at least three years, and, if accepted, pay fees, including £25 stamp duty, amounting altogether to £64 18s. Further details can be obtained on application to the Secretary of the College.

ROYAL COLLEGE OF SURGEONS OF EDINBURGH

This College has two grades—its Licence and its Fellowship. Licentiates may be of either sex, and for the Fellowship women are eligible also.

Licence

As an original qualification the Licence is only granted after fulfilment of the regulations of the Scottish Conjoint Board, but as an additional qualification it can be obtained by those already possessed of a registrable or equivalent qualification in medicine. In this case the candidate has to pass a written, oral, and clinical examination in surgery and surgical anatomy, and may be asked to operate on the dead body.

The fee is £15 15s., of which £10 10s. is returned to unsuccessful candidates. On due cause being shown, a special examination may be granted, the fee being £20, of which £10 is returned to a candidate if he is not approved.

Fellowship

Candidates for the Fellowship must be not less than 25 years of age, and have been in the practice or study of their profession subsequent to registration for at least two years, and must hold either a surgical degree from a university recognized for that purpose by the College, or a registrable diploma obtained as the result of an examination which includes surgery as well as medicine and midwifery. Candidates are examined in (*a*) the principles and practice of surgery, including surgical anatomy, (*b*) clinical surgery, and (*c*) one optional subject, which they may choose from among the following: surgical pathology and operative surgery, ophthalmology, laryngology, otology and rhinology, gynaecology, obstetric surgery, anatomy, and dental surgery and pathology. The examination is written, oral, and clinical or practical. A candidate who desires to be examined must give one month's notice. After having passed the examination he must lodge with the Clerk to the College a petition asking that his name be placed before the College for election as a Fellow. This petition must be signed by two Fellows, as proposer

and seconder, who should be sufficiently acquainted with the candidate to vouch that he is in every way a suitable candidate for the Fellowship Examinations are held four times a year—January, March, July, and September It is desirable that either the proposer or the seconder should be resident in Edinburgh *Candidates are not allowed to appear more than three times at the examinations*

The admission fee is £20 and after passing the examination the candidate shall pay the sum of £30 to the College funds In the case of Licentiates of the College £10 thereof shall be remitted in consideration of the fees they have already paid For further information application should be made to the Clerk of the College Mr David Thomson, 49, George Square Edinburgh, from whom a copy of the *Laws Relating to the Fellowship by Examination* may be obtained

ROYAL FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW

This body possesses two classes—Licentiates and Fellows The regulations applying to the former correspond with those respecting candidates for the Licence of the Royal College of Surgeons of Edinburgh Candidates for the single Licence are examined in surgery (including clinical surgery and surgical anatomy) The fee is £15 15s , and examinations are held quarterly Candidates for the Fellowship must be qualified medical men of not less than two years standing and 24 years of age Candidates approved at this examination are then eligible for election as Fellows The Faculty can also elect three Fellows annually without previously submitting them to examination, provided they "have highly distinguished themselves in medical science or practice " They must be of not less than ten years standing and 40 years of age

The fee for the Fellowship is £50 Further information can be obtained from Mr Walter Hurst, Faculty Hall, 242, St Vincent Street Glasgow

Ireland

MEDICAL REGISTRATION IN THE IRISH FREE STATE

The Medical Practitioners Act, 1927 (Irish Free State), provides for the establishment of a Medical Registration Council for the Irish Free State The main functions of the Council will be (1) to keep a register of medical practitioners who may desire to practise permanently or temporarily in the Irish Free State, and (2) to exercise disciplinary power with regard to all medical practitioners who are on the register and engaged in practice in the Irish Free State The first schedule of the Act contains the agreement between Great Britain, the Irish Free State, and Northern Ireland This agreement provides for the nomination of a member of the General Medical Council, formerly made for Ireland by His Majesty on the advice of the Privy Council, to be made henceforth by His Majesty in Council on the recommendation of the Governor of Northern Ireland The nominations of members of the General Medical Council by universities and medical corporations in Ireland and the election of a member of the General Medical Council by registered medical practitioners in Ireland will be in all respects the same as heretofore The constitution of the General Medical Council and of the several Branch Councils as formerly existing under the Medical Acts, and the powers of holding qualifying examinations and granting diplomas for the purpose of registration in the general *Register* formerly vested in certain universities and medical corporations in Ireland, are not affected by the establishment of the Irish Free State or of Northern Ireland, and for the purpose of the preparation and keeping of the general *Register* the General Medical Council and the Branch Council for Ireland shall have the same powers and jurisdict under the Medical Acts as they exercised formerly T agreement provides also that any person who is cr be registered in the general *Register* shall be entit on the payment of a prescribed fee to be registered in t *Irish Free State Register*, but this fee will not be pay by any person who, on the date of the establishment the *Irish Free State Medical Register*, is registered on t general *Register* Then follow provisions with regard the erasure from the *Register* of the name of a person on account of misconduct

The *Irish Free State Medical Register* was establis on May 26th, 1928, this being the date appointed by t Medical Registration Council The *Register* on establ ment contained the names of every medical practiti who was registered in the general *Medical Register* im diately before May 26th, 1928, and who either was th resident in the Free State, according to his addres stated in the general *Register*, or was living outside th Free State and applied to the Council within one mo before May 26th, 1928, to be registered No fee f registration was charged in such cases

For registration in the *Irish Free State Medical Re* subsequent to its establishment a fee is required, toget with a prescribed form of application A person is eligi for registration if he is at the time of application regis in the general *Medical Register*, or if he possesses requisite qualifying diploma granted by colleges or bod in the Free State as set out in the Act Candidates f medical appointments made under the Appointments Co mission must be registered in the *Irish Free State Me Register* Application for further information may b made to the Registrar, Medical Registration Counc Room 35, Upper Fitzwilliam Street, Dublin

THE IRISH UNIVERSITIES

There are three universities in Ireland, each with a medical faculty These are, in the Irish Free State, the University of Dublin (usually known as Trinity College, Dublin) and the National University of Ireland , and, in Northern Ireland, the Queen's University of Belfast

UNIVERSITY OF DUBLIN: TRINITY COLLEGE

This university grants two degrees in medicine (M B and M D), two in surgery (B Ch and M Ch), two in midwifery (B A O and M A O), and a post graduate diploma in public health It also grants post graduate diplomas in gynaecology and obstetrics, for which nine months study is required, and in psychological medicine, for which two months' study is required The degrees are granted to those who, having passed the professional examinations have also graduated in arts

PROFESSIONAL EXAMINATIONS

A candidate for the Final Examination for the M B B Ch , and B A O degrees must be a matriculated student of at least five years' standing The examinations which students must pass are the Preliminary Scientific the Intermediate Medical, and the Final Before admission to any of these examinations students must have completed the courses of study in the subjects involved

Preliminary Scientific This covers (*a*) chemistry and physics, (*c*) botany and zoology The three divisions may be taken together or at different times

Intermediate Medical —This is divided into two parts (*a*) anatomy, physiology, organic chemistry, and histology (*b*) applied anatomy and applied (clinical) physiology The two parts may be taken separately or together

Final Examination —Part I Pathology and bacteriology, materia medica and therapeutics Part II (*a*) midwifery and gynaecology , (*b*) medicine, mental diseases, medical jurisprudence, and hygiene , (*c*) surgery in its branches, including clinical ophthalmology The th

sections of Part II may be taken separately or together. In either case the full curriculum must have been completed, and the Final Examination cannot be completed before the end of the fifth year.

M.D.—The candidate must have passed all the qualifying examinations in medicine, surgery, and midwifery, and have taken, or have been qualified to take, the degree of B.A. three years previously. He must send in a thesis for approval. Subsequently the Regius Professor of Physic and an assessor will discuss with him questions connected with the thesis, and also examine him viva voce on other medical subjects of a more general nature.

M.Ch.—The candidate must be a B.Ch. of not less than three years' standing and have been engaged in practice for two years.

M.A.O.—The candidate must be a B.A.O. of not less than two years' standing and must produce satisfactory evidence of having been engaged for two years in the study of obstetric science. The examination is specially directed to obstetrics and practical gynaecology.

Further information regarding courses of instruction, etc., may be obtained from the Registrar of the School of Physic, Trinity College, Dublin.

QUEEN'S UNIVERSITY, BELFAST

The degrees granted by the Medical Faculty of this university are as follows: Bachelor of Medicine (M.B.), Bachelor of Surgery (B.Ch.), Bachelor of Obstetrics (B.A.O.), Doctor of Medicine (M.D.), Master of Surgery (M.Ch.), Master of Obstetrics (M.A.O.). The university also confers a diploma in public health. The first three degrees mentioned serve as a qualification for admission to the *Medical Register*, and are not granted separately. In addition to matriculating and passing his professional examinations, a candidate for these degrees must have passed three of the regulation five years as a student at the Belfast School of Medicine. Degrees in dental surgery (B.D.S. and M.D.S.) are conferred by the university, and also a diploma in dental surgery (L.D.S.) and a diploma in psychological medicine.

PROFESSIONAL EXAMINATIONS

The examinations for the M.B., B.Ch., B.A.O. are four in number. The first deals with: (1) inorganic, organic, and practical chemistry, (2) experimental and practical physics, (3) botany and practical botany, (4) zoology and practical zoology. It is divided into two parts, of which botany and zoology form one. The Second Examination covers anatomy and physiology (both theoretical and practical), and may be taken at the end of the second year of the student's career. The Third Examination includes: (1) pathology and practical pathology, (2) materia medica, pharmacology, and therapeutics, (3) medical jurisprudence, and (4) hygiene. Candidates who have passed the Second Examination may present themselves for Part I of the Third (Nos. 1 and 2) at the close of the third year, and for Part II (Nos. 3 and 4) at the end of the winter session of the fourth year.

The Final Examination includes: (1) medicine, (2) surgery, (3) midwifery, (4) ophthalmology and otology. The student must pass in all subjects at once at the end of his fifth year, or he may divide the examination into two parts—namely, (1) systematic, (2) clinical, practical, and oral. The first part may be taken at the end of the fourth year, but for the second part the candidate may not present himself until the end of his fifth year, but students invariably take both parts at the end of their course. No certificate in regard to the study of the subjects of this examination will be valid unless the work was done subsequent to passing in all the subjects of the Second Examination.

THE HIGHER DEGREES

Candidates for the degree of Doctor of Medicine must be graduates in medicine of at least three years' standing, unless they hold also a degree of the university in arts or science, in which case a standing of two academic years will suffice. Moreover, candidates must be able to show that the interval has been passed in the pursuit of such courses of study or practical work as may be prescribed. The degree may be conferred either (*a*) after a formal examination, or (*b*) in recognition of the merits of a thesis or of some piece of original study or research carried out by the candidate, followed by an oral or other examination in its subject. When an ordinary examination is imposed it will include (1) a written paper on the principles and practice of medicine, (2) a commentary on a selected clinical case, (3) a clinical and viva voce examination, and (4) a written paper and clinical or practical and viva voce examination on a subject chosen from the following list: (*a*) human anatomy, including embryology; (*b*) physiology, (*c*) pathology, (*d*) pharmacology and therapeutics, (*e*) sanitary science and public health, (*f*) forensic medicine and toxicology, (*g*) mental diseases. The regulations for the degrees of M.Ch. and M.A.O. are of the same general nature.

NATIONAL UNIVERSITY OF IRELAND

The National University of Ireland carries on most of its medical educational work through three constituent colleges—University College, Dublin; University College, Cork; and University College, Galway. Each of these provides a full medical curriculum, and all candidates for the medical degrees of the university must pass three of their five years of study at one or other of them. These years do not count except after matriculation in the Medical Faculty. The candidates at each constituent college are examined by the university, and a common standard of education is secured by all courses of instruction and the regulations concerning them having to be approved by the Senate, after considering report thereon from the General Board of Studies of the university. In addition to the ordinary degrees in Medicine and Surgery, the university grants those of Bachelor and Master of Obstetrics, Bachelor and Doctor of Science in Public Health, and Bachelor and Master in Dental Surgery, as well as Diplomas in Public Health and in Psychological Medicine.

Application for other information may be made to the Registrar, National University of Ireland, 49, Merrion Square, Dublin, C.17.

THE IRISH CORPORATIONS

There are, in the Irish Free State, three licensing bodies other than the Medical Faculties of the universities; and in Dublin, just as in London, there is a Royal College of Physicians of Ireland, a Royal College of Surgeons in Ireland, and an Apothecaries' Hall. In Dublin, as in London and in Edinburgh, the two Colleges have formed an examining Conjoint Board, which is responsible for the recommendation of candidates to the two bodies for their respective licences. The Apothecaries' Hall of Ireland, like the Apothecaries' Society of London, gives its licence separately.

THE CONJOINT BOARD IN IRELAND

This body requires of candidates either the passage of its own preliminary examination in the subject of general education or proof that the candidate has passed one of the tests accepted by the General Medical Council as well as passing in the pre-registration examinations in chemistry and physics and biology.

PROFESSIONAL EXAMINATIONS

There are three professional examinations, the first of which cannot be passed earlier than the end of the second winter session, nor the final before the conclusion of full five years of medical study. Before being admitted to any of them the candidate must show that he has studied the different subjects in practice and theory for the requisite periods, certificates to this effect being accepted from the authorities of most of the recognized medical schools at home and abroad. The First Examination deals with Part I—(*a*) biology, (*b*) applied chemistry. Part II—

anatomy, including embryology, physiology, including physiological chemistry and histology The Second Examination deals with (*a*) pathology, including morbid anatomy, clinical pathology, and bacteriology, (*b*) materia medica, pharmacy, and therapeutics, (*c*) forensic medicine, hygiene, and public health, (*d*) ophthalmology and aural surgery, and may be taken separately

Final Examination —This is divided into three divisions, which cannot be completed until at least five years have passed in medical studies other than those for the pre-registration examinations, and five years at least since the beginning of the curriculum The divisions are (*a*) medicine, including fevers, mental diseases, and diseases of children, (*b*) surgery, including operative surgery, (*c*) midwifery, including diseases of women and newborn children, and the theory and practice of vaccination

Fees —Preliminary Examination, £2 2s Re-examination, £2 2s Pre-Registration Examination, £3 3s Re-examination in Chemistry, £2 2s, in Physics £1 1s First Professional Examination—Part I, £17 17s, Part II, £10 10s, Second £9 9s, Final, £6 6s Re-examination fee is £2 2s for each division

Diploma in Psychological Medicine

There are two examinations in connexion with this diploma Part I consists of (*a*) anatomy and physiology of the nervous system, (*b*) psychology Part II—(*a*) neurology, including clinical and pathological neurology, (*b*) psychiatry, or psychological medicine, including its legal relationships Fees, £6 6s for each part

Further information can be obtained from Mr Alfred Miller, Secretary of the Committee of Management, Royal College of Surgeons, St Stephen's Green, Dublin

ROYAL COLLEGE OF PHYSICIANS OF IRELAND AND ROYAL COLLEGE OF SURGEONS IN IRELAND

The Diploma in Public Health

Every candidate for the Diploma in Public Health must observe the following rules

1 A period of not less than two years shall elapse between the attainment by a candidate of a registrable qualification in Medicine Surgery, and Midwifery and his admission to the Final Examination for a Diploma in Public Health

2 The curriculum for the D P H shall extend over a period of not less than twelve calendar months subsequent to the attainment of a registrable qualification

3 Every candidate shall produce evidence of having attended during a period of not less than five months, at an institution approved by the Licensing Body granting the Diploma practical instruction in—(*a*) Bacteriology and Parasitology (including Medical Entomology), especially in their relation to diseases of man and to those diseases of the lower animals which are transmissible to man (*b*) Chemistry and Physics in relation to Public Health (*c*) Meteorology and Climatology in relation to Public Health

At least 180 hours must be devoted to Course (*a*), of which not less than 150 hours shall be occupied in practical laboratory work At least 90 hours must be devoted to Course (*b*) of which not less than 70 hours shall be occupied in practical laboratory work At least 10 hours must be devoted to Course (*c*)

4 Every candidate shall produce evidence of having received during not less than 80 hours at an institution or from teachers approved by the Licensing Body granting the Diploma instruction in the following subjects (*a*) the Principles of Public Health and Sanitation (30), (*b*) Epidemiology and Vital Statistics (20) (*c*) Sanitary Law and Administration (including Public Medical Services (20) (*d*) Sanitary Construction and Planning (10) [The numbers indicate the normal proportion of time to be given to each subject]

5 Every candidate shall produce evidence that he has attended for three months on the clinical practice of a recognized Hospital for Infectious Diseases and has received therein instruction in the methods of administration At least thirty daily attendances of not less than two hours in each week shall be required

6 Every candidate shall produce evidence that he has, during a period of not less than six months, been engaged in acquiring a practical knowledge of the duties, routine and special of Public Health Administration under the supervision of a Medical Officer of Health who shall certify that the candidate has received, from this Officer or other competent Medical Officer during not less than three hours on each of sixty working days practical instruction in these duties and also those relating to (*a*) Maternity and Child Welfare Service, (*b*) Health Service for Children of School Age (*c*) Venereal Diseases Service, (*d*) Tuberculosis Service, (*e*) Industrial Hygiene, (*f*) Inspection and Control of Food, including meat and milk

Certificates of having received the prescribed instruction in Public Health Administration must be given by a Medical Officer of Health who devotes his whole time to Public Health work, or by the Medical Officer of Health of a sanitary area having a population of not less than 50,000, or in Ireland the Medical Superintendent Officer of Health of a County or County Borough having a population of not less than 50,000

7 The examination for the Diploma shall be divided into two parts, Part I and Part II

8 The examination for Part I shall include the following subjects Bacteriology and Parasitology (including Medical Entomology), Chemistry and Physics, and Meteorology and Climatology, in relation to Public Health

9 The examination for Part II shall include the following subjects Hygiene and Sanitation (including Sanitary Construction), Epidemiology and Infectious Diseases Sanitary Law and Vital Statistics, Public Health Administration The examination shall be written and oral, and shall include practical examinations in Infectious Diseases, Food inspection and Inspection of premises—dwellings, factories, workhouses, schools, etc

ROYAL COLLEGE OF PHYSICIANS OF IRELAND

Those whose names already appear on the *Medical Register* can obtain the separate Licence in Medicine of this College and its Licence in Midwifery In either case an examination has to be passed in the subjects indicated questions on midwifery, hygiene, and jurisprudence being included in the examination for the Licence in Medicine For the Licence in Midwifery practitioners of over five years standing are exempted from examination by printed questions The other grades of the College are Members and Fellows The former are admitted after an examination which is open to graduates in medicine of recognized universities whose names are on the *Medical Register* of the United Kingdom or the Irish Free State, and Licentiates in medicine of the Royal College of Physicians and deals with the general subjects of medicine Fellows are selected, by vote, from among the Members of the College

Fees —For the Licence in Medicine 15 guineas Special Examination £21 For the Licence in Midwifery 8 guineas Special Examination, 16 guineas For the Membership 20 guineas to a Licentiate of the College, 35 guineas to other a special examination costs 10 guineas extra The Fellowship £35, in addition to stamp duty, £25

Information as to special examinations and other matters can be obtained from the Registrar, the Royal College of Physicians, Kildare Street, Dublin

ROYAL COLLEGE OF SURGEONS IN IRELAND

This body, besides granting a Licence in Surgery, admits those possessed of registrable surgical qualifications to its Fellowship under certain conditions Its Licence is usually granted conjointly with that of the College of Physicians but it is given separately to holders of a registrable qualification in medicine, provided the College is satisfied that adequate courses of study have been pursued, and provided its own provisional examination is passed The examination is held on its behalf by the Conjoint Board and is identical with the ordinary surgical portion of the examinations imposed by that body

The Fellowship —Candidates for the Fellowship must pass two examinations, of which the first is in anatomy (including dissections), physiology, and histology, and the second in surgery (including surgical anatomy) and pathology Both examinations are partly written, partly practical, and partly viva voce, while the Final Examination includes the performance of operations All subjects of either examination must be passed at one time, and in neither can a candidate be admitted who has been rejected in any of its subjects by any other licensing body within three months Candidates are not admitted to the Primary Examination except on evidence that they have already passed an examination in anatomy, physiology, and histology, held by some university or other body whose degrees or licences entitle the holder to admission to the *Medical Register*, if, however, the candidate's name is on the

Colonial or Foreign List in the *Medical Register*, at the discretion of the Council. Candidates for the Final Examination must be over 25 years of age, produce a certificate of general good conduct signed by two or more Fellows of the College, and, if successful, must make a declaration before admission to the effect that they do not conduct dispensing practices, and will not do so as long as they are Fellows.

Fees.—Candidates for the Licence pay 5 guineas for examination, which sum, if they pass, is counted as part of the fee payable on admission to the Licence, this being 25 guineas. Candidates for the Fellowship pay 5 guineas for each examination, the total of 10 guineas being reckoned as part of the fee payable on admission to the Fellowship. That fee is 25 guineas in the case of those who are already Licentiates, and 40 guineas in the case of others.

APOTHECARIES' HALL OF IRELAND

A diploma is granted by this Hall which entitles the holder to be registered as a practitioner of medicine, surgery, and midwifery, and confers also the privileges of an apothecary. Women candidates are eligible.

Fees.—Primary Examination (Parts I and II), £21; Final Examination, £21. Subjects of examination: Primary, Part I, Anatomy and Physiology. Primary, Part II, Materia Medica and Pharmacy; Medical Jurisprudence and Hygiene; Pathology. Final Examination: Medicine, Surgery, and Midwifery. Candidates must enter for and pass at the one time in Anatomy and Physiology. They are at liberty to enter for the subjects of the Final Examination at separate times, but the Final Examination cannot be completed until a period of three years has elapsed from the date of passing Primary Examination, Part II.

Application for other information should be made to the Registrar, 95, Merrion Square, Dublin.

Medical Schools and Colleges

LONDON

Information as to the fees at each of the various metropolitan medical schools, and the scholarships, prizes, and junior appointments which they offer, will be found in the following pages. The courses they provide are fundamentally the same, and in all of them the arrangements made are such as to meet the requirements of students of every class—of those who are aiming at the diplomas of the English Conjoint Board or the Apothecaries' Society, not less than of those who have London or other university degrees in view. At all, too, special facilities are offered to students who have commenced their professional education at Oxford or Cambridge, and are seeking the medical degrees of those universities.

Charing Cross Hospital

Situated in the centre of London, Charing Cross Hospital Medical School is the most easily accessible of all the London schools. Instruction is given in all the subjects for the final examinations of the universities of London, Oxford, and Cambridge, the Conjoint Board, and other licensing bodies. In addition to the clinical appointments held by every student, courses of systematic lectures, demonstrations, and tutorial classes are held in all subjects of the curriculum. In the School there are departments devoted to bacteriology, clinical pathology, biochemistry, materia medica, public health, operative surgery, as well as laboratories for research. By reason of the abundance and variety of the material available for investigation, the Institute of Pathology, with its whole-time staff of scientific workers and its completely equipped laboratories, offers peculiar advantages to students in this branch of medicine. The Library has ample accommodation, and contains nearly 4,000 volumes, including modern textbooks and contemporary reviews. The Pathological Museum is organized in two sections: one devoted to specimens illustrating general pathological conditions; the other consisting of the Lockyer Collection, the finest collection of gynaecological and obstetrical specimens in the country.

The hospital contains 300 beds, and this number is likely to be increased in the near future by the provision of additional accommodation for paying patients. There are special departments for diseases of ear, nose and throat, the eye, the skin, for children, for mental disorders, for orthopaedic surgery and massage, for *x*-ray, electrical and light treatment, for dental surgery, and for tuberculous and diabetic cases. A number of beds are set apart for diseases peculiar to women and for midwifery cases, and the hospital serves an extensive and thickly populated district in gynaecological and obstetric work. The out-patient department dealt with over 2,800 new cases last year, with 132,000 attendances.

The Students' Club provides for the athletic, recreational, and social life of the students by means of a 13-acre sports ground, by common rooms, restaurant, etc., and by sections of the club designed for a particular purpose, such as the debating society and the dramatic society.

Scholarships.—The following are offered annually: (*a*) For students commencing medical studies, two scholarships, each of the value of £50. (*b*) For students commencing clinical studies, two University Scholarships, each of the value of £120, in pathology; one University Scholarship, value £120; and one Open Scholarship, value £75, in anatomy and physiology. In addition there are a number of exhibitions.

Prizes.—(1) The Llewellyn Prize, £25, for highest distinction throughout final course of studies. (2) Williams Travers Prize, £15, midwifery and gynaecology. (3) Pereira Prize, £4 4s., clinical commentary. (4) T. H. Green Prize, £5 5s., clinical commentary. (5) Clinical Surgery Prize, £3 3s. (6) John H. Morgan Prize, £10. (7) Steadman Prize in Pathology. (8) Numerous class prizes and medals. (9) The Governors' Clinical Gold Medal.

Fees.—The fees are as follows: Entrance, Primary, and Intermediate, £16 16s.; Final, £10 10s.; Annual, 38 guineas.

Further information may be obtained on application to Eric A. Crook, M.A., M.Ch., F.R.C.S., Dean of the Medical School, Charing Cross Hospital, London, W.C.2.

Guy's Hospital

The hospital contains 646 beds in constant occupation. Twenty-five beds are set apart for diseases of the eye, and 42 for the most urgent and interesting medical cases, which form the subjects of the weekly clinical lectures. There are special wards of 49 beds for the reception of cases of diseases of women and for cases of difficult labour. Beds are also allotted to the throat and ear departments, the departments of orthopaedics, neurology, and dermatology, the department for the treatment of diseases of the genito-urinary system, and the children's department; there are also some special beds for the treatment of syphilis.

The residential college fronts the east gate of the hospital, providing accommodation for resident students. This contains a dining hall, reading rooms, a library of general literature, and a gymnasium for the use of the residents and of the members of the Clubs Union. The athletic ground at Honor Oak Park is reached from the hospital in fifteen minutes. The Gordon Museum of Pathology, the Wills Library, the departments of chemistry, physics, pathology, and pharmacology, and the school buildings in general, afford opportunities for a liberal education and for research, and provide the full curriculum for all medical degrees and diplomas. New departments of anatomy, physics, and biology have recently been completed. They are equipped on the most modern lines, and provide ample accommodation for teaching and research. Special classes are held for the First and Second Examinations for medical degrees of the University of London, for the pre-medical examination, and for the First and Final F.R.C.S.Eng. Examinations. Special teaching is provided to meet the requirements of the Universities of London, Oxford, and Cambridge in general pathology and pharmacology.

Appointments.—All appointments are made according to the merits of the candidates, as determined by a committee of the medical staff. Sixteen out-patient officers, eight house-physicians, twenty assistant house-surgeons, eight house-surgeons, two ophthalmic house-surgeons, two genito-urinary house-surgeons, two house-physicians (children's department), two house-physicians (dermatological and neurological), and nine resident obstetric assistants are

appointed annually The house-physicians and house-surgeons, obstetric residents, ophthalmic house-surgeons, and genito-urinary house-surgeons hold office for six months each, and receive free board and lodging in the college Every student is provided with rooms and commons in the hospital during the period of his "take in" as senior dresser In addition to the clerkships and dresserships in the medical and surgical wards, students are appointed to the posts of clinical assistant dresser, or clerk in the special departments of ophthalmology, laryngology, gynaecology, diseases of children, diseases of the nervous system, dermatology, otology, actinotherapeutics, anaesthetics, dentistry, orthopaedics, vaccine, tuberculosis, fractures, and genito-urinary and venereal disease, clinical assistantships in the various special departments are open to post-graduates

Scholarships, Prizes, etc —The following scholarships in Arts and Science are awarded A Open Junior Scholarships (1) An Arts Scholarship of the value of £100, (2) a Science Scholarship of the value of £100, these are awarded annually in June or July (3) A War Memorial Scholarship of the value of £200, awarded alternately in Arts and Science This scholarship is open every other year, the next award will be made in June or July, 1932 (in Arts) B Confined Scholarship in Science A Junior Science Scholarship of the value of £100 is offered for competition annually in June or July to candidates who have attended the preliminary science classes at this school Candidates for these scholarships (male students only) must be under 20 years of age on August 1st of the year of the competition C University Entrance Scholarships (1) A War Memorial Scholarship of the value of £100, (2) an Exhibition of the value of £60, both of these are awarded annually in June or July Candidates will be examined in two of the following subjects at their option (1) anatomy and embryology, (2) physiology, (3) pathology, including bacteriology, (4) biochemistry The examination is held in common with the Medical School of St Thomas's Hospital and the Medical College of St Bartholomew's Hospital Full particulars as to the scholarships may be obtained from the Dean of the Medical School Junior prizes for general proficiency, £20, £15 £10, Hilton Prize for dissection, £5, Michael Harris Prize for anatomy, £10, Sands-Cox Scholarship for physiology, £15 for three years, Wooldridge Memorial Prize for physiology, £10, Beaney Prize for pathology, £34, Treasurer's Medal and Prize in medicine, Treasurer's Medal and Prize in surgery, and the Golding-Bird Gold Medal and Scholarship for bacteriology (£20) are awarded annually after competitive examination The Gull Studentship in pathology, of the value of £250 per annum, the Beaney Scholarship in materia medica, of the value of about £70, and the Anderson Demonstratorship in clinical chemistry, value £175 per annum, are awarded without examination to enable research to be carried on in these subjects An Arthur Durham Travelling Scholarship of £100 is awarded triennially The Griffiths Demonstratorship in Pathology of the value of £320 per annum, and the Hilda and Ronald Poulton Fellowship, value £150 per annum, are awarded without examination

An annual composition fee is paid by all students until a registrable qualification is obtained Further information may be obtained from the Dean of the Medical School, Guy's Hospital, London Bridge, S E 1.

King's College Hospital

The medical school of this hospital, which is situated at Denmark Hill, deals with the Final Examination subjects of the medical curriculum. The hospital was opened in 1913, and is one of the most modern and best equipped in England The number of attendances in the casualty and out patient departments during the year 1930 amounted to 287,983 In the education at the hospital a special feature has always been the individual attention given to each student The studies are co-ordinated under the direction of senior members of the honorary staff, assisted by medical, surgical, obstetric, and pathological tutors

The Hall of Residence for members of the medical school is situated on Champion Hill Both the Hall and the athletic ground are within ten minutes' walk of the school

Appointments —Sixteen resident medical and surgical officers are appointed half-yearly, as well as dressers and clerks in the wards, out-patient departments, post-mortem rooms, and special departments Each of the special departments has several clinical assistants There are five registrars and four tutors, all of whom receive salaries

The Clubs and Societies Union combines athletics, music, and other societies connected with the school, and provides also a common room

Scholarships, etc —At entrance Science Scholarship £75 At commencement of Final Studies Anatomy and Physiology Scholarship, £75, Pathology Scholarship, £75, two Raymond Gooch Scholarships, each £120, two Burney Yeo Scholarships, each £105 (for Oxford and Cambridge students) Seaman Scholarships, £50 a year up to five years Epsom College Scholarship, £100, Senior Scholarship £40 Teed Prize, Tanner Prize, Ferrier Prize in Neurology, Class Prizes and Medals

Fees —The composition fee is 93 guineas if paid in one sum Entrance fee of 10 guineas includes membership of the Clubs and Societies Union

Dental School —This school was opened in October 1923, and, in conjunction with King's College, provides complete courses for dental degrees and diplomas

The calendar of the school can be obtained on application to the Dean, H Willoughby Lyle, M D, F R C S or to the Secretary of the Medical School, S C Ranner, M A, King's College Hospital, Denmark Hill, S E 5.

The London Hospital

This hospital, with its medical college and dental school is situated in the Mile End Road, E 1 The hospital contains 839 beds, which are in constant use During 1930 14,256 patients passed through the wards and 86,554 out patients received treatment Of the latter number, 40,078 received treatment in the departments for diseases of the ear, nose, throat, eye, skin, and teeth, and in the paediatric, orthopaedic, venereal, radiological, electro- and physico-therapeutical, and inoculation departments The number of major operations which were performed amounted to 7,401.

The hospital presents, therefore, a large field for clinical instruction, and in its wards and out patient and special departments exceptional opportunities are afforded for acquiring an extensive and practical experience of all phases of disease

A clinical unit in medicine, under the charge of a whole-time director, assisted by an assistant director, two assistants, and two house-physicians, provides for the more elaborate methods of diagnosis and treatment, and takes a leading part in the initiation and co-ordination of medical research To each medical and surgical firm throughout the hospital there is attached a first assistant, who is responsible for instructing the clerks or dressers of the firm in elementary medicine and surgery, and who assists the honorary members of the firm in the preparation of their demonstrations In the department of obstetrics and gynaecology there is a first assistant and two resident accoucheurs In the department for children's diseases there is a first assistant, one house-physician, and two clinical assistants Special courses of lectures and demonstrations are arranged in medicine and surgery and in their ancillary subjects Opportunities for research are provided under the supervision of the staff

All the departments are modern and adapted for the teaching of all subjects in the various curricula Special courses of instruction are held in preparation for the examinations of the University of London, for the Fellowship of the Royal College of Surgeons, and for the Membership of the Royal College of Physicians Special entries can be made for the medical and surgical practice of the hospital. Two resident hostels are provided for the convenience of students and the holders of house appointments. Recent additions to hospital and college buildings include a cardiac department and a laboratory for the manufacture of certain preparations of radium The athletic ground, of over thirteen acres, is at Highbury Park, and is open to all members of the Clubs Union

Appointments —The salaried appointments, open to past students of the hospital, are those of assistants to the medical unit, first assistants to the medical and surgical firms, obstetric registrar, assistants to the department of obstetrics and gynaecology; medical, surgical, and obstetric tutors, clinical assistants in the medical, surgical, ophthalmic, aural, light and skin, orthopaedic, and electrical departments, and in the Institute of Pathology There are appointed annually 4 resident accoucheurs, 14 resident

house-physicians and 22 resident house-surgeons, 14 resident receiving-room officers, 8 resident emergency officers, 8 clinical assistants to the medical out-patient department, and 16 clinical assistants to the surgical out-patient department also paid and unpaid clinical assistants in the various special departments. In addition, there are numerous assistantships, clerkships, and dresserships in the departments of medicine, surgery, gynaecology, and obstetrics.

Scholarships and Prizes.—The following is a list of scholarships and prizes.—At entrance: Price Scholarship in science, £100 Two open scholarships, each of the value of £100 Scholarships open to students of Oxford and Cambridge Universities: (1) £100, anatomy and physiology; (2) £100, pathology. Entrance Scholarship in science, £50; Epsom Scholarship, "free medical education." After entrance: Buxton Prize in anatomy and physiology, £40; Letheby Prizes in organic chemistry and chemical pathology, £25, Prizes in clinical medicine, surgery, and obstetrics and gynaecology, £20 each; Duckworth Nelson Prize in practical medicine and surgery, £10; Hutchinson Prize in clinical surgery, £60; Treves Prize in clinical surgery, £15; Sutton Prize in pathology, £20; Sir Andrew Clark Prize in clinical medicine and pathology, £14; T. A. M. Ross (prov. acc) Prize in clinical medicine and pathology, £10 10s., Anderson Prizes in elementary clinical medicine, £20; Dressers' Prizes, £20; Practical Anatomy Prizes, £10; Arnold-Thompson Prize in medical and surgical diseases of children, £15, Liddle Prize, £120; Francis Farmer Entrance Scholarship in chemistry and physics, £25, Harold Fink Prize in dental surgery, £8 8s. The "London" Prizes in dental surgery and pathology, £5 5s, and in dental prosthesis, £5 5s Seven class examination prizes, each of the value of £3 3s, are offered for competition at the end of the courses of lectures in the dental curricula. Funds to the value of over £113,000 permit of financial assistance being given to students and graduates engaged in medical research

Fees.—Entrance fee, 20 or 15 guineas, according to examinations passed; annual fee, 40 guineas.

Full information may be obtained from the Dean at the London Hospital Medical College, Mile End, E.1.

The Middlesex Hospital

The school and hospital are in Mortimer Street, W 1, close to Oxford Circus, Goodge Street, and Great Portland Street stations There are a gymnasium, squash rackets court, common rooms, and restaurant within the hospital precincts, and an athletic ground within easy reach The hospital contains over 470 beds, including a wing containing 90 beds for patients suffering from cancer. There are special wards for maternity and gynaecological cases, for neurological cases, for cases of venereal disease, and for diseases of children and of the skin and eye. The newly built west wing and residents' house are now occupied.

The medical school, which includes the Bland-Sutton Institute of Pathology, the S A Courtauld Institute of Biochemistry, the Barnato-Joel Laboratories, and the Ferens Institute of Otology, is completely equipped for teaching the entire medical curriculum, including the pre-medical subjects, chemistry, physics, and biology. The Bland-Sutton Institute, under the direction of the Professor of Pathology, contains large pathological and public health laboratories, and smaller rooms for original investigation, as well as a pathological and anatomical museum Bacteriological and microscopical examinations of material from the wards, operating theatres, and out-patient departments are carried out in the laboratories, and senior students are eligible for clerkships in connexion with this work Junior assistants in the pathological and bacteriological laboratories are elected annually from recently qualified students. Every facility is given for original research. The Biochemical Institute is under the charge of the Professor of Biochemistry, and contains teaching and research laboratories in addition to those devoted to the routine chemical pathological work of the hospital The Barnato-Joel Laboratories offer unrivalled opportunities for the study of cancer in both its clinical and pathological aspects.

Appointments.—Twenty-nine resident appointments are open annually for competition among students of the hospital. The officers reside and board in the residential college free of expense. Two casualty medical and two casualty surgical officers, and four resident officers to the special departments, are appointed annually. Eight house-surgeons are appointed every year at intervals, after examination; eight house-physicians are also appointed annually at similar intervals. An obstetric and gynaecological house-surgeon is appointed every six months. One senior and two junior resident assistant anaesthetists are appointed annually. Nine registrars, each at a salary of £300 per annum, are appointed annually. In the out-patient departments and wards the appointments are: clerk and dresser to the physicians and surgeons to out-patients; clerk in the departments for diseases of the skin and nervous diseases; dressers to the department for diseases of women, to the ophthalmic surgeon; to the throat and ear department, to the orthopaedic department, and to the dental surgeon. Extern midwifery clerks and post-mortem clerks are also appointed, every student secures six months' experience in midwifery and gynaecology without leaving London. The appointments are so arranged that every student may, during his course, hold all the out-patient and in-patient clerkships and dresserships. Non-resident qualified clinical assistants are appointed in the medical, surgical, skin, neurological, ophthalmic, throat and ear, odontological, children's, and electro-therapeutic out-patient departments.

Scholarships.—There are two Entrance Scholarships, value £100 each. Two annual Entrance Scholarships, of the value of £90 and £60 respectively, are open to students of the Universities of Oxford and Cambridge who have completed the curriculum for, or passed the examinations in, anatomy and physiology Students joining the school in the previous April are eligible. The Freer Lucas Scholarship is annually awarded on the nomination of the headmaster to a pupil of Epsom College who has passed the first examination for medical degrees (Preliminary Scientific Examination) There is also a scholarship, value £50, awarded annually to students from New Zealand. In addition to the Entrance Scholarships, there are numerous other valuable scholarships, prizes, and exhibitions open to students of the hospital, including the Brodrip Scholarships, value £60 and £40; Lyell Gold Medal and Scholarship, value £55 5s, Freeman Scholarship, value £30, John Murray Gold Medal and Scholarship, value £25, Hetley Clinical Prize, value £25, Leopold Hudson Prize, value 11 guineas, and the Second Year's Exhibition, value 10 guineas.

The rebuilding of the hospital is being completed without the loss of a single bed, or any disorganization of its clinics.

Fees.—(*a*) Pre-medical students For one year or less, £21. (*b*) Students who have completed the Preliminary Science course Entrance fee, 25 guineas, payable on joining the medical school, five annual fees of £45. The annual fee for further attendance at the medical school, if a registrable qualification has not been obtained, is £23. (*c*) Oxford and Cambridge and other students who have completed the Intermediate course. entrance fee, 15 guineas, three annual fees of £45, further annual fees as above. These fees are inclusive and cover the cost of instruction in vaccination, fevers, etc., and also the subscription to the amalgamated clubs and hospital journal

Further information may be obtained from the Dean or the School Secretary.

St. Bartholomew's Hospital

This institution fills one side of Smithfield and Giltspur Street, covering the greater part of a large island of ground separated practically from all other buildings; it is on the edge of the City, and easily reached from all parts of London. The hospital contains 762 beds Extensive buildings, opened in July, 1907, occupy part of the ground acquired from the old Bluecoat School, and these materially enhance the attractions of the hospital as a place of medical study The medical school buildings, including the library, the museum, and the chemical, biological, and anatomical departments, have now at their side a very large building, which includes club rooms for the Students' Union, a writing room, luncheon and dining halls, new quarters for the resident staff, and an out-patient department and accommodation for special departments of such large size as to be unsurpassed by any hospital in the kingdom During the year 1909 a second block of new buildings was completed. These form the pathological department, and include, in addition to an extensive post-mortem room, large and well-equipped

laboratories for clinical pathology, pathological histology, bacteriology, and chemical pathology, altogether forming the most complete pathological department in the country A further large block in Giltspur Street was acquired in 1923, and has been equipped by the construction of new lecture theatres and extensive laboratories for physics, chemical physiology, experimental physiology, histology, and pharmacology The new block of surgical wards and five operation theatres (one attached to each surgical unit), with accommodation for 250 patients, was opened in June, 1930 One of the old blocks previously used for surgical cases has been reconverted for the housing of an enlarged gynaecological and obstetrical unit, with separate operation theatres attached The Students' Union owns grounds of some ten acres in extent for recreative purposes at Winchmore Hill, which is easily accessible from the hospital

Special classes are held for students preparing for the Preliminary Scientific and other examinations, for the M B , M D of the Universities of Oxford, Cambridge, and London, and for the higher surgical degrees at the same universities, including the M Ch Oxon , M Chir Cantab , M S Lond , and F R C S Eng

Clinical Units —Special clinical units have been established in medicine and surgery, each under the charge of a professor and director, who devotes the whole of his time to the purpose of hospital practice, teaching, and research In each unit there are an assistant director and four assistants, for whom special laboratory accommodation has been provided by a gift from the Sir William Dunn Trustees The appointments of clerks and dressers in these departments are open to all students, and arrangements are made for all students to study in these units during a part of their clinical course

Appointments —Clinical clerks to the physicians and to the physician accoucheur, and dressers to the surgeons and in the casualty department, are chosen from the students , clerks and dressers are also selected from the students to attend in the out-patient rooms, in the special departments (ophthalmic, orthopaedic, gynaecological, children's, laryngological, aural, dermatological, venereal, electrical, and dental), and in the post-mortem room Chief assistants and clinical assistants are selected from qualified men appointed yearly to help in the general medical, surgical, and in special departments Ten house physicians and ten house-surgeons are appointed annually During their first six months of office they act as " junior " house physicians and house surgeons, and receive a salary of £80 a year During their second six months they become " senior " house-physicians and house-surgeons, and are provided with rooms by the hospital authorities, and receive a salary of £80 a year A resident midwifery assistant, an ophthalmic house-surgeon, a house surgeon to the skin and venereal department, and a house surgeon for diseases of the throat, nose, and ear are appointed every six months, and are provided with rooms and receive a salary of £80 a year. Three resident administrators of anaesthetics are appointed—the senior for one year at a salary of £150, and two juniors for six months with a salary at the rate of £80 per annum—and all are provided with board and rooms An extern midwifery assistant is appointed every three months, and receives a salary of £80 a year.

Scholarships —Five Entrance Scholarships and Exhibitions are annually awarded after examinations held in July, and one (the Shuter Scholarship) after examinations held in June The subjects of examination and conditions of eligibility for these scholarships are (1) and (2) One scholarship, value £100 and one exhibition, value £60, in any two of the following subjects human anatomy and embryology physiology, pathology (including bacteriology), biochemistry Candidates must have completed their examinations in anatomy and physiology in a British school or university outside the London Metropolitan area (3) One scholarship, value £100, in not fewer than three of the following subjects chemistry physics botany, zoology, and physiology, limited to students under 21 years of age who have not entered on the medical or surgical practice of any London medical school (4) An entrance scholarship in arts, of the value of £100, in mathematics , Latin or Greek, or French or German , a second language or chemistry or physics (5) The Jeaffreson Exhibition in the same subjects as No 4, of the value £50 Candidates for Nos 4 and 5 must be under 19 years of age (6) The Shuter Scholarship value £50, in anatomy and physiology, is confined to Cambridge graduates The total value of the scholarships and prizes is over £1 500 annually

Further information and a handbook can be obtained on application to the Dean of the Medical College St Bartholomew's Hospital, E C 1

St. George's Hospital

This school is at Hyde Park Corner, and is carried on in connexion with St George's Hospital, an institution having a service of 436 beds, of which 100 are at the convalescent hospital at Wimbledon It provides for the instruction of its students in the preliminary and intermediate subjects of the curriculum at the teaching centre of London University established at King's College and University College The school at Hyde Park Corner is devoted entirely to the teaching of clinical subjects great attention being paid by the members of the staff to individual teaching A number of special courses are given, in which the requirements of university and all other examinations receive careful attention

The St George's Hospital Club consists of an amalgamation club, with smoking and luncheon rooms on the hospital premises, and other students' clubs, with an athletic ground at Wimbledon Students have the advantage of a well-filled library of medical and scientific books A register of accredited apartments and a list of medical men and others willing to receive St George's men as boarders may be seen on application to the Dean

Appointments —Two house-physicians, two house surgeons, and two casualty officers are appointed every two months The house officers reside and board in the hospital free of expense The casualty officers are non-resident, and receive salaries at the rate of £60 per annum After the student has held a house appointment the following are, among others, open to him assistant resident physician at £250 per annum , assistant resident surgeon at £250 per annum , medical officer to the Atkinson Morley Convalescent Hospital at £300 per annum ; medical registrarship at £200 per annum surgical registrarship at £200 per annum , medical officer to the biochemical department at £100 per annum , assistant curatorship of the museum, £100 per annum , obstetric assistantship, resident, at £100 per annum , the post of resident anaesthetist at £100 per annum

Scholarships —The following Entrance Scholarships and Exhibitions in anatomy and physiology and in general pathology are awarded in July to candidates who have passed the second M B London or corresponding examination, Sambrooke William Brown Exhibition of the value of £120 Jun William Brown Exhibition of the value of £80 , Anne Selina Fernee Scholarships (two) of the value of £80 each An Selina Fernee Exhibitions (two) of the value of £60 Dew Pendlebury Scholarship of the value of £50 , and Exhibitions each of the value of £40 and up to four in number Other prizes to the value of £200 are awarded annually to the students of the hospital

Fees —First year (First M B or pre medical course) £36 15s , second and third years, £42 each For the course of clinical study, in the fourth and subsequent years entrance fee, £10 10s , annual composition fee, £42 No entrance fee is payable by St George's students who have studied at King's College or University College

Further information may be obtained from the Dean of the Medical School.

St. Mary's Hospital

This hospital and medical school are situated close to Paddington Station (G W R), having on one side a population district of 500,000 persons, and on the other side the residential district of Kensington and Bayswater The hospital contains 348 beds, and extensions recently completed have provided two new operating theatres In a scheme of affiliation, for teaching purposes, of seven neighbouring hospitals, the teaching facilities extend over 1,000 beds By arrangement with the Lock Hospital students take the courses of instruction in venereal diseases there The athletic ground (ten acres) is situated at Wembley, and can be reached in twenty minutes by a constant service of trains

Clinical Facilities —Clinical units in medicine and surgery were established in 1920, and have now been formally recognized by the University Grants Committee, St Mary's being one of the six medical schools in London which enjoy this privilege Under this system professors of medicine and surgery, with competent assistants, give their whole time to teaching and research This means a regularity of teaching and a degree of individual attention that are only possible where units exist The system also provides additional salaried posts which are open to students after qualification

Teaching of Midwifery —The hospital has lying in beds, and in addition to the instruction thus obtained each student attends a short course at Queen Charlotte's Hospital as part of his training in midwifery, without additional fee Under the new building scheme it is proposed to institute additional lying in wards

Institute of Pathology and Research —Students specially interested in pathology and bacteriology have singular advantages at St Mary's The Institute comprises seven special departments, the whole being under the personal direction of Sir Almroth Wright, F R S Research scholarships of £200 each are awarded annually to students working in the departments of the Institute , and research beds are provided Clerkships in pathology and bacteriology and chemical pathology, lasting for a period of three months, are open to students of the fifth year, and enable them to carry out the pathological and bacteriological investigations of the wards, and learn the necessary technique under supervision Seventy two of these posts are available annually Numerous appointments are open to newly qualified members of the medical school, including ten salaried posts, with salaries varying from £200 to £750 per annum

Rebuilding of the Medical School —Building operations began in August 1930, and it is hoped that they will be completed by the autumn of 1932 The foundation stones of the Medical School and Pathological Institute were laid by H R H The Duchess of York on June 30th, 1931 The new school will contain departments for the teaching of all preliminary and intermediate subjects, and will include a Students' Club, dining and billiard rooms, and a gymnasium and swimming bath

Complete Curriculum —The medical school provides complete courses of instruction, and students can join at once on passing a preliminary examination in arts Terms begin in October, January, and April

Entrance Scholarships —Two Entrance Scholarships of £210 each are awarded annually in July by nomination on the lines of the Rhodes Scholarships The Palmer Scholarship of £25 per annum for two years is awarded in alternate years The Geraldine Harmsworth Scholarship (£200) and one or more University Scholarships of £200 are awarded annually in July

Fees —Composition fees for entire curriculum (6 years) £205 in one sum or £215 by five annual instalments Composition fee for clinical curriculum (3 years) 95 guineas in one sum or 100 guineas by two annual instalments As an alternative students may pay an annual fee of 40 guineas with an entrance fee

St. Thomas's Hospital

This school and hospital are situated in Lambeth, on the south bank of the Thames, facing the Houses of Parliament, and form one of the well known architectural features of London

The school buildings, which are separated from the hospital by a quadrangle, comprise lecture theatres, laboratories and classrooms well adapted for the modern teaching of large bodies of students in the subjects of the medical curriculum A splendid library and reading room and a complete museum are open to all students from 9 a m to 5 p m , on Saturdays to 1 p m St Thomas's House the new Students Club, comprises spacious dining and club rooms, etc , and in addition provides accommodation for some sixty resident students The terrace affords facilities for exercise and recreation The sports ground more than nine acres in extent, is at Chiswick It can be reached in forty minutes from the hospital , it is admirably adapted for football, cricket, lawn tennis, and athletic sports

The hospital proper contains 644 beds In addition to the ordinary provisions of a great hospital there are connected with the out patient department physicians' and surgeons' rooms provided with ample seating accommodation, so that students are enabled to follow closely the practice and teaching of the out patient staff There is a full complement of special departments, and connected with the hospital a special tuberculosis department gives opportunity for instruction of students There is a clinical theatre, centrally situated, so as to facilitate the illustration of lectures by patients from the wards and out patient room , it is arranged also for lantern demonstrations Clinical units in medicine and surgery have been established The maternity ward, containing 21 beds, gives students full facilities for maternity training, under supervision, within the precincts of the hospital This obviates any necessity for supplementary instruction elsewhere, and fully prepares the student for the extern maternity practice of the hospital district The revised regulations of the examining bodies can thus be fully complied with

Appointments —All hospital appointments are open to students without charge A resident assistant physician and a resident assistant surgeon at £225 each per annum, and a resident anaesthetist at £200 per annum, are appointed annually Eight hospital registrars—three medical, one diseases of children, and four surgical—at an annual salary of £250 each, rising by £25 to £300, are appointed yearly The tenure of these offices may be renewed for a term not exceeding three years A pathological registrar to the department of obstetrics and gynaecology (at an annual salary of £250), an ophthalmic registrar (at an annual salary of £200), and an orthopaedic registrar (unpaid) are appointed yearly Ten resident casualty officers and anaesthetists (including two senior) are appointed every six months Seven house physicians (including two obstetric house physicians and one house physician to the department of diseases of children) and nine house surgeons (including two ophthalmic house surgeons, one orthopaedic house surgeon, and two house surgeons to the ear, nose, and throat department) are appointed every six months Thirty six or more clinical assistants in the special departments are appointed every three months, and hold office for six months if recommended for re election Clinical clerkships and dresserships to the in patient and out patient departments are available to the number of 400 each year

Scholarships —There are five Entrance Scholarships one in arts giving two years free tuition , one of £150 and one of £60 in chemistry physics and biology, for students who have not received instruction in anatomy or physiology , one of £100 and an exhibition worth £60, in any two of the following subjects anatomy, physiology, chemistry, or pathology for students who have completed their examinations in anatomy and physiology for a medical degree in any of the universities of the United Kingdom or the Colonies and have not entered as clinical students in any London medical school The money value and subjects of examination of the remainder are as follows (*a*) William Tite Scholarship for second year students £25 , (*b*) and (*c*) Musgrove Scholarship or (alternately) Peacock Scholarship each for third year students and tenable for two years £35 each (*d*) Mead Medal medicine pathology and hygiene , (*e*) Wainwright Prize medicine , (*f*) Toller Prize, medicine , (*g*) Cheselden Medal surgery and anatomy (*h*) Clutton Memorial Medal in clinical surgery biennial (*i*) Beaney Scholarship £50 biennially surgery and clinical pathology , (*j*) Solly Medal and Prize biennially reports of cases , (*k*) Sutton Sams Prize biennially reports of cases (*l*) Bristowe Medal, pathology and morbid anatomy (*m*) Hadden Prize, pathology and morbid anatomy (*n*) Grainger Testimonial Prize £31 10s anatomy and physiology , (*o*) Louis Jenner Research Scholarship tenable for two years £60 annually pathology (*p*) School Council Research Scholarship £250 per annum (*q*) John and Temple Research Scholarship value £450 per annum (children)

Fees —The annual fees are For each year of study £50 These fees cover all tutorial classes but do not include instruction in infectious fevers

Special courses of instruction are given for various examinations Further information may be obtained from the Secretary to the Medical School St Thomas's Hospital Albert Embankment S E 1

University College Hospital

The school, which forms part of the corporation of University College Hospital, is in immediate proximity to the hospital in University Street, and opposite University College. It comprises departments of medicine, surgery, midwifery and gynaecology, pathology including morbid anatomy, chemical pathology, biochemistry and bacteriology, cardiography, forensic medicine, mental physiology and mental diseases, dental surgery, practical pharmacy, and other departments for the study of special diseases, such as those of the eye, skin, ear and throat, venereal diseases, and for instruction in anaesthetics, electro-therapeutics, and skiagraphy. The hospital and school have acquired the National Dental Hospital and College as their dental departments, thus providing every facility for the study of dental subjects. The Royal Ear Hospital has also been amalgamated as the Ear, Nose, and Throat Department, and a new hospital for in- and out-patients, close to University College Hospital, is completed.

The school thus provides the final course of study for the degrees of the Universities of Oxford, Cambridge, London, Durham, and other British universities, and for the diplomas of the Royal Colleges of Physicians and Surgeons in medicine and in dental surgery, and the Licence of the Society of Apothecaries. Each department is also equipped for more advanced work, and provides facilities for research.

Clinical units in medicine, surgery, and obstetric medicine are now in operation. The whole-time directors of the units are concerned with the organization of the teaching generally, but the honorary staff is responsible for the largest share of the teaching in the wards and out-patient department of the hospital.

The new buildings of the obstetric hospital of 74 beds (rendered possible by the Rockefeller benefaction), the new Residents' House (with accommodation for 33 residents and students), the extension of the Nurses' Home, and the new research laboratories for the Medical School, are now finished and in full occupation.

A Students' Hostel adjoins the Medical School. Large, airy, and handsomely furnished bed-sitting rooms, each fitted with hot and cold running water, are available.

Appointments.—The qualified appointments, in addition to a number of posts as house-physicians and house-surgeons and obstetric assistants, include the appointments of resident medical officer, medical registrars, surgical registrar, obstetric officer, Harker Smith radium registrar, ophthalmic registrar, casualty medical officers, casualty surgical officers, assistants in ear, nose and throat, skin and venereal diseases departments, and house anaesthetists.

Scholarships.—The following scholarships and prizes are open to competition: Two Goldsmid Entrance Scholarships entitling the holder to the final course of medical study; one Goldsmid Entrance Exhibition entitling the holder to a reduction by £80 of the fees due for the full course of final medical study, open to candidates who are graduates in arts or science of a university of the British Empire; and a Filliter Entrance Scholarship in pathology, entitling the holder to a reduction by £52 10s. of the fees due for the full course of final medical study. The examination for these scholarships is in any two of the following subjects: anatomy, physiology, and general pathology. Candidates for the Filliter Exhibition need take pathology alone. Radcliffe Crocker Travelling Scholarship in dermatology for one year, value about £280; the Graham Scholarship in pathology of a sum not exceeding £400 per annum; Leslie Pearce Gould Research Scholarship in surgery for one year, value about £200; the Atkinson Morley Scholarship of £45 a year for three years, awarded after examination in the theory and practice of surgery; the Atchison Scholarship of £55 a year for two years for general proficiency in medical studies; the Magrath Clinical Scholarship, value about £150; the Filliter Exhibition in pathology of £30; the Percival Alleyn Prize for the advancement of surgery by research, value about £75; the Graham Gold Medal for research work; four Fellows Medals in clinical medicine; Liston Medals in clinical surgery; the Bruce Medal in pathology and surgery; two Tuke Medals in pathology; the Erichsen Prize for practical surgery; and the Roberts Prize in obstetrics and gynaecology.

Fees.—The fee for the full course of final studies at the school is 112 guineas if paid in one sum, or 115 guineas if paid in two instalments. Fees for vaccination, fevers, and pharmacy not included.

Particulars of general and special courses can be obtained on application to the Dean of the Medical School, University College Hospital, University Street, W.C.1.

Westminster Hospital

The school, with its hospital situate in Broad Sanctuary opposite Westminster Abbey, provides for the education of its students in the preliminary and intermediate subjects of the University of London at King's College, Strand, and University College. The rest of the work is done in the school buildings near the hospital. The number of in-patients averages 4,000 and out-patients upwards of 30,000 annually, and the hospital and school afford ample facilities for instruction in all branches of medicine and surgery.

Appointments.—A medical and surgical registrar are appointed annually, each with a salary of £150, and an obstetric registrar with a salary of £150. An assistant medical registrar and an assistant surgical registrar, salary £100 per annum each, are appointed for six months. A senior resident and casualty officer, salary £104 per annum and board, appointed for six months, may be extended for a further period of six months. A medical registrar to the children (Wander scholar), salary £230, is appointed for one year. Three house-physicians, three house-surgeons, three assistant house-physicians, three assistant house-surgeons, and a resident obstetric assistant are appointed after examination, and are provided with rooms, commons, and salary of £52 per annum, except the assistant house-physicians and the assistant house-surgeons, who are provided with commons only. The assistant house-physicians, after three months' service, become house-physicians for a further period of six months, and the assistant house-surgeons, after three months' service, become house-surgeons for a further period of six months. Two house-anaesthetists are appointed for three months, non-resident, salary £50 per annum. Clinical assistants to the assistant physicians and assistant surgeons, and to the officers in charge of special departments, are appointed from among the qualified students. Every student must perform the duties of out-patient dresser for three months, and afterwards hold the office of in-patient dresser for three months. He is also required to serve two terms of three months each as medical clinical clerk to the in-patient physician, and one term as gynaecological clinical clerk. Two pathological clerks are appointed every three months to assist in the post-mortem room. No student is eligible as an in-patient dresser or clinical clerk until he has passed the Second Examination of the Conjoint Board, or an equivalent examination. Clerks and dressers in the special departments of hospital practice are periodically appointed. So far as vacancies permit, students of other hospitals are admitted to in-patient dresserships or clerkships.

The governors of the hospital have now completed the extensive improvements and alterations to the hospital, which render it a still more efficient teaching institution, with an increased number of beds. An annexe devoted to radium therapy and research, containing twenty-two beds, has recently been opened.

The athletic ground is situated at Tooting, and can be reached in twenty minutes from the hospital.

Scholarships.—The following open scholarships are offered for competition during the year 1931–32. In the winter session two scholarships in anatomy and physiology, £75 each. In the spring two scholarships in anatomy and physiology, £75 each. A certain number of scholarships have been allotted to universities of England, Wales, and the Colonies, and to public schools. These scholarships are awarded entirely on the nomination of the Principal of the university or school.

Fees.—The annual composition fee is £40. An entrance fee of 10 guineas is payable by all students—namely, primary and intermediate students, £10 10s.; students entering for the final subjects, £8 8s. These fees, which include subscription for membership of the Clubs Union, are subject to alteration from time to time as the School of Medicine may direct.

Further information and a prospectus can be obtained on application to the Dean at the Westminster Hospital, Westminster, S.W.1.

London (Royal Free Hospital) School of Medicine for Women

The school is situated at 8, Hunter Street, Brunswick Square, W.C.1, close to the Royal Free Hospital. It is, like all the other London schools which have so far been mentioned, one of the constituent schools of the University of London. The laboratories are extensive and well lighted, and are fully equipped for the examination courses of the University of London and the Royal Colleges of Physicians and Surgeons. Research laboratories are attached to all departments. A large, well-equipped library, common room, Union Room, and refectory are provided for the use of students. Resident accommodation for 80 students is provided in students' chambers attached to the school.

The Royal Free Hospital, Gray's Inn Road, W.C.1, has 280 beds, all of which are available for clinical instruction. The obstetrical and gynaecological unit controls 68 beds. A large maternity district is served from the unit with a separate maternity hostel in the Essex Road, Islington. There are separate departments for diseases of the eye, ear, and skin, children and infant welfare, venereal diseases, orthopaedic surgery, massage, light, electrical and *x*-ray work, dentistry, and casualty. Students attend the practice of one of the fever hospitals of the London County Council and receive special instruction in lunacy at Horton Mental Hospital, Epsom; they are also admitted to the practice of a number of special hospitals, and hold clerkships and dresserships at the Elizabeth Garrett Anderson Hospital, the Cancer Hospital, Hospital for Sick Children, Great Ormond Street, the National Hospital for Nervous Diseases, the South London Hospital, and the Royal Ophthalmic Hospital. The work of the school includes preparation for the Primary Fellowship examination, and also for the Medical School and general hospital course for dental students.

Appointments.—Qualified students of the school can obtain appointments as house-physicians and house-surgeons, obstetric assistants, surgical, gynaecological, and medical registrars, assistant pathologists, assistant anaesthetists, medical electrician, skiagrapher, and clinical assistants and demonstrators in various subjects.

Scholarships.—The Isabel Thorne Entrance Scholarship, value £30, the St. Dunstan's Medical Exhibition, value £60 a year for three years, which may be extended to five years, the Alfred Langton Scholarship of £50 a year for two years, the Flora Murray Bursary of £50, and the Mabel Sharman-Crawford Scholarship, value £20 a year for four years, are offered for competition in each year. The Sir Owen Roberts Memorial Scholarship of the value of £75 a year for four years; the Mrs. George M. Smith Scholarship of the value of £50 a year for three years, which may be extended to five years; the Dr. Margaret Todd Scholarship of the value of £37 10s. a year for four years; and the Sarah Holborn Scholarship of the value of £20 a year for three years, which may be extended to five years, are awarded in alternate years. The School Jubilee Bursary of £50 a year for three years is offered every third year. The Bostock Scholarship, value £90 a year for two or four years, is awarded by the Reid Trustees on the result of an examination held in May by the University of London every fourth year. The holder of the scholarship must enter the London School of Medicine for Women. The Lieutenant Edmund Lewis and Lieutenant Alan Lewis Memorial Scholarship, of the value of £25 a year for four years, is awarded every fourth year. The John Byron Bursary of £20 a year for two years, the Julia Ann Hornblower Cock Prize of £60, the Helen Prideaux Prize of £60, the Mabel Webb Research Scholarship of £30 for two years, the Fanny Butler Scholarship of £16 a year for four years, together with many other scholarships and prizes, are offered on sundry conditions. The Dr. Edith Pechey-Phipson Post-Graduate Scholarship of £100 is awarded annually. Altogether the school offers annually £1,350 in scholarships. Various missionary societies also offer scholarships on certain conditions, and assist women who wish to go to India and other countries as medical missionaries.

Fees.—Courses for the University of London degrees and the diplomas of the Conjoint Board in England, and other qualifications: £50 per annum throughout the course.

The Students' Union exists to promote corporate action of the students on matters of common interest, to promote and maintain athletic and other clubs, and to issue a school magazine. All students are required to become members of the Union.

Further information can be obtained from the Warden and Secretary.

King's College

In the Faculty of Medical Science instruction is given in the preliminary and intermediate subjects of the first and second examinations leading to the degree of M.B., B.S. of the University of London, of the corresponding examinations of other universities, and of the Conjoint Examining Board of the Royal Colleges of Physicians and Surgeons. The courses are open to women students on the same terms as to men.

Regular students who have completed their preliminary and intermediate examinations proceed to one of the associated or other hospitals to pursue their studies for the final examinations. Special courses in anatomy and physiology are held in preparation for the primary examinations for the Fellowship of the Royal College of Surgeons.

A course for the degree of the University of London and for the diploma of the Royal College of Surgeons in dental surgery is given in conjunction with King's College Hospital Medical School.

Scholarships.—The entrance scholarships are: (1) Two Warneford Scholarships, each £30 for four years; subjects—selected from mathematics, classics, divinity, and science. (2) One Sambrook Scholarship of £30 for three years; subjects of examination selected from mathematics, classics, and science. The holders of the preceding awards must proceed to King's College Hospital. (3) Worsley, £100, paid in five annual instalments. (4) Rabbeth Scholarships, value £30 and £15, in July, for the best student of the first year. (5) Daniell Scholarship, £40, awarded on the results of the University Honours Examination. (6) The Layton and Berridge Studentships, each £150 per annum, and (7) numerous prizes.

Full information as to admission, fees, and scholarships can be obtained from the Dean of the Faculty of Medical Science, King's College, Strand, W.C.2.

University College

This institution, one of the principal component parts of the University of London, possesses a Faculty of Medical Sciences whose work covers all the subjects included in the group commonly known as the preliminary medical sciences—namely, physics, chemistry, botany, and zoology; and also the intermediate medical sciences—namely, anatomy (including embryology and histology), physiology, biochemistry, and pharmacology. The anatomy building, provided by the munificent gift of the Rockefeller Foundation of New York, was opened on May 31st, 1923, by His Majesty the King. This building forms part of the block which includes physiology and pharmacology. Research work is undertaken in all the above-named departments. The College undertakes the education of students in all the subjects mentioned, leaving them free to complete their education in the strictly professional subjects—medicine, surgery, and the like—at any one of the recognized schools of advanced medical studies. The work is somewhat differently arranged, according to whether the student has in view the degrees of the University of London or the diplomas of the Royal Colleges. In either case the whole work to be done is divided into courses devised to meet the requirements of different examinations, and students can join the College for any of them. Women students are admitted to all courses on the same terms as men. The general arrangements for the benefit of students include membership of the Union Society or the Women's Union Society, with use of the College gymnasium and the athletic grounds. There is also a collegiate residence for about eighty-six men students at Ealing and for about seventy women students at Byng Place, Gordon Square.

Scholarships.—The scholarships and exhibitions obtainable include the Bucknill Scholarship, value 160 guineas, in chemistry, physics, botany, and zoology (the successful student must complete his work at University College Hospital Medical School); two Entrance Exhibitions in the same subjects, each of the value of 55 guineas; a Faculty of Medical Sciences

Entrance Scholarship, value £30 a year, for three years ; and the Bayliss-Starling Memorial Scholarship (physiology and/or biochemistry), £120.

Fees.—The fees for the courses covering the work of the First Examination for medical degrees of the University of London, and in both parts of the Second Examination, amount to 115 guineas. The fees for the courses covering the corresponding examinations held by the Conjoint Board in England also amount to 115 guineas. These fees may be divided into payments for the different courses which it may be desired to take out, but do not cover tuition for more than a stated period.

A handbook specially relating to this faculty may be obtained on application to the Secretary of University College, London, Gower Street, W.C.1.

THE PROVINCES

There are in England and Wales, not counting London, ten medical schools, each supplying instruction in the full medical curriculum. Accounts of them here follow. In several cases information is appended about hospitals other than those directly connected with the school in question ; such hospitals, officially and unofficially, play a part in the education which the students of the school receive, and in any case serve as places of additional or post-graduate study.

Oxford and Cambridge

At both Oxford and Cambridge there are medical schools which furnish unsurpassed opportunities for obtaining a good knowledge of the preliminary sciences and of anatomy, physiology, and pathology. The laboratories are excellently furnished, and the teaching staffs most distinguished. Both schools provide a full medical curriculum, and there is no essential reason why the student should not complete his career at either of them ; but this is not commonly done, and is never, in the ordinary way, advised by the university medical authorities. The local hospitals—the Radcliffe Infirmary at Oxford and Addenbrooke's Hospital at Cambridge—though well equipped, are comparatively small. Students are therefore encouraged, as soon as they have completed the earlier examinations and taken a degree in arts, to join one of the London medical schools, and thus spend the time of their preparation for the final examinations in a city where the opportunities for gaining clinical knowledge are greater and more varied. A considerable proportion of Oxford and Cambridge medical students take the London Conjoint diplomas before graduating in medicine and surgery at their own university. The experience gained by holding resident hospital appointments is naturally of much advantage when sitting for the Final M.B. examination and when engaged in composing a thesis.

Birmingham

The school in this city is carried on by the Medical Faculty of the University of Birmingham, its students having an adequate number of good laboratories, classrooms, and other necessaries devoted to their use by the university. The clinical work is done at the General and Queen's Hospitals, which are amalgamated for the purpose. Together they have upwards of 700 beds for medical, surgical, and special cases, with an array of special departments of all kinds, including one for lying-in women. Clinical instruction is given in the wards and out-patient and special departments daily, and formal clinical lectures are delivered weekly throughout the session. Special tutorial classes are also held alike for the degrees of Birmingham and some other universities, and for the diplomas of corporations.

Appointments.—The large number of appointments open to past or other students includes the following:—At the General Hospital: two surgical registrars, £100 (commencing) a year ; one resident medical officer, salary £155 a year ; one resident surgical officer, salary £180 a year ; one assistant resident surgical officer, salary £100 a year ; one resident pathologist, salary £70 a year ; two visiting anaesthetists, salary £50 a year ; two resident anaesthetists, salary £120 a year ; four house-surgeons, office tenable for nine months, £70 a year ; one house-surgeon to the gynaecological and one to the special departments, each tenable for six months, £70 a year ; four house-physicians, post tenable for six months, £70 a year. At the Queen's Hospital: one resident medical registrar, salary £200 a year ; two resident surgical officers, £100 a year, tenable for three years ; three house-physicians, three house-surgeons, one obstetric and one ophthalmic house-surgeon, one ear, nose, and throat house-surgeon, and one house-physician for duty at the Nerve Hospital (associated with Queen's Hospital), tenable for six months, salary £70 a year, with board, lodging, and washing ; one casualty house-surgeon, tenable for three months, salary £70 a year, with board, lodging, and washing. At the City Public Assistance Institutions: five resident medical officers. At the Birmingham General and Branch Dispensaries: twelve resident surgeons. At the Birmingham Mental Hospitals: five assistant medical officers. At the City Fever Hospitals: three assistant medical officers. At the Children's Hospital: one resident surgical officer, one resident medical officer. At the Birmingham and Midland Eye Hospital: four resident surgeons. At the Orthopaedic and Spinal Hospital: two clinical assistants (non-resident). At the Ear and Throat Hospital: one house-surgeon, £70 a year ; four clinical assistants (non-residents). Four non-resident appointments are in the gift of the Public Assistance Committee.

Scholarships.—There are numerous money and other awards for students of sufficient merit, among them being the following: Frank Fletcher and Catherine Fletcher Scholarships (not less than two per annum), tenable for five years, each of the annual value of £100, awarded on higher school certificate examination of the Joint Matriculation Board ; the Walter Myers Travelling Studentship of £300, offered each alternate year for research work and tenable abroad ; the Sands-Cox Scholarship of £42 (an entrance scholarship in the Faculty of Medicine, awarded on higher school certificate examination of the Joint Matriculation Board (July)) ; four Queen's Scholarships of £10 10s. each, awarded annually at the second (Part II), third, fourth, and final university examinations respectively ; one or more Sydenham Scholarships, allotted on entrance to students who are the sons of deceased medical men ; the Ingleby Scholarships (two) of £10 for proficiency in midwifery and diseases of women ; the Arthur Foxwell Memorial Gold Medal (clinical medicine) ; the Sampson Gamgee Memorial Medal for surgery (Final M.B.) ; the Russell Memorial Prize (for examination in nervous diseases, final year) ; the Priestley Smith Prize in ophthalmology, value about £6 (awarded in the final examination) ; and the Peter Thompson Prize in anatomy (value about £6) for students in their third university year. There is also a scholarship of £46 17s. 6d. for students proceeding to a degree in dental surgery. University Clinical Board Prizes are awarded annually as follows: Senior Medical Prize, gold medal ; Senior Surgical Prize, gold medal ; Midwifery Prize, gold medal ; Junior Medical Prize, silver medal ; Junior Surgical Prize, silver medal.

Fees.—The composition fee for university classes is £106 5s. This covers all the work required for the degrees of Birmingham and some other universities, and for the ordinary qualifications of licensing corporations, but not the additional courses required for the Fellowship of the Royal College of Surgeons of England, the diploma and degrees of the university in State medicine, and some other special work. The total cost for the six years' curriculum, including hospital and examination fees, is estimated at £242 17s. 6d.

Other information should be sought from the Registrar, or the Dean of the Medical Faculty, University, Edmund Street, Birmingham.

Bristol

The school is carried on by the Faculty of Medicine of the university, and provides full instruction for all its degrees and for the diploma in dental surgery.

Clinical Instruction.—The allied hospitals (Bristol Royal Infirmary and Bristol General Hospital) have between them more than 660 beds and extensive out-patient departments, special clinics for diseases of women and children, and those of the eye, throat, and ear, in addition to large and well-equipped departments for dental work and large outdoor maternity departments. The Bristol

Royal Infirmary has now been selected by the National Radium Commission as a Radium Centre. At each of these institutions there are well-arranged pathological museums, post-mortem rooms, and laboratories for morbid anatomy. There are also laboratories for work in clinical pathology, bacteriology, and cytology, in which special instruction is given in these subjects. Departments are provided and well equipped for *x*-ray work, both for diagnosis and treatment, for electrocardiography, and for the various forms of electrical treatment, including high-frequency currents, electric baths, Finsen light treatment, and massage. The students of the school also attend the City and County Mental Hospital, the Ham Green Fever Hospital, the practice of the Royal Hospital for Sick Children and Women, containing 100 beds, and that of the Bristol Eye Hospital, with 40 beds. In addition, by the kind permission of the Health Committee of the Bristol City Council, students may attend the clinical practice at Southmead Hospital, which has 556 beds. The new Orthopaedic Hospital at Winford is also available.

Appointments.—(1) Undergraduate: Medical clerkships, surgical dresserships, also ophthalmic, obstetric, pathological, dermatological, ear, nose, and throat clerkships, are tenable at the Bristol Royal Infirmary and the Bristol General Hospital. In these institutions the dressers reside in rotation free of charge. (2) Post-graduate: At the Bristol Royal Infirmary: four house-surgeons, one casualty house-surgeon, two house-physicians, one house-physician for cancer research wards, one resident obstetric officer, one gynaecological and dermatological house-surgeon, one ear, nose, and throat house-surgeon, one assistant house-surgeon and house-physician to the ophthalmic department, one dental house-surgeon, and one unpaid assistant (usually a resident student) to the senior resident medical officer. All these appointments are for six months. Salary in each case at the rate of £60 per annum, with board, apartments, and laundry, except the casualty house-surgeon and the dental house-surgeon, who receive £80 per annum. In each case the salary is increased by £40 per annum if the officer is re-elected for another six months. From the resident medical officers a senior resident medical officer is appointed at a salary of £200 per annum. At the Bristol General Hospital: senior resident medical officer, £200 per annum; casualty house-surgeon, £100 per annum; two house-physicians, £80 per annum; two house-surgeons, £80 per annum; resident obstetric officer, £80 per annum; house-surgeon to special departments, £80 per annum. All the £80 appointments carry a salary of £100 for residents who have previously held another of them; the dental house-surgeon (non-resident), £300 per annum. All these appointments are for six months, except that of senior resident medical officer, which is for two years.

Scholarships.—The following are among the scholarships and other awards open to students of the school: The Ashworth Hallett Scholarship, value £40, open to women only; two Martyn Memorial Pathological Scholarships of £10 each; the Tibbits Memorial Prize, value 7 guineas, for proficiency in practical surgery; the Committee's Gold and Silver Medals, for fifth-year students, for general proficiency; the Augustin Prichard Prize, value about 6 guineas, for proficiency in anatomy; the Henry Clark Prize, value 11 guineas, for proficiency in gynaecology; the Crosby Leonard Prize, value 6 guineas, for proficiency in surgery; the Suple Surgical Prize, a gold medal and 7 guineas; the Suple Medical Prize, a gold medal and 7 guineas; the Henry Marshall Prize, value £12, for dressers; the H. M. Clarke Scholarship, value £15, for proficiency in surgery; the Sanders Scholarship, value £22 10s., for general proficiency; the Barrett-Roué Scholarship for proficiency in diseases of the nose, throat, and ear, or value £17, open to men only; Lady Haberfield Scholarship, value about 25 guineas; Bristol and Bath City Scholarships and the Scholarships offered by the counties of Leicestershire, Somerset, Wilts, Dorset, etc., are tenable in the university.

Some of the Fellowships awarded by the Colston Research Society for research in the university are allotted to the Faculty of Medicine.

A Beaverbrook Fellowship, tenable for three years, is open to all members of the uni... holding a medical qualification.

The Markham Skerritt Memorial Prize is awarded every three years to that member of the university, not a member of the medical board, who, in the opinion of that board, has published the best original work during the three years.

The Paul Bush Gold Medal is awarded in alternate years to the best resident medical officer at the Bristol Royal Infirmary.

Fees.—The fee for all the courses required for the medical curriculum, including hospital practice, is 205 guineas, paid by annual instalments.

Further information as to scholarships, curricula, and fees can be obtained from the Dean of the Faculty of Medicine, or the Registrar of the University, Bristol.

University of Durham College of Medicine

This, the Medical School of the Faculty of Medicine of the University of Durham, is in the neighbouring city, Newcastle-upon-Tyne. Its classes and lectures are arranged to meet the requirements of the university in all the degrees which the latter grants, and also those of the other examining bodies. The students do their work in the preliminary sciences at Armstrong College, also part of the university. Hospital practice is carried out at the Royal Victoria Infirmary, a general hospital containing more than 600 beds, where there are facilities for the study of the various special subjects. Students do their practical midwifery at the Princess Mary Maternity Hospital, which contains 90 beds, and has an annual indoor and outdoor attendance on 3,000 cases. In the Heath wing of the school itself there is a gymnasium and a set of rooms for the separate use of the students. The bacteriological department is adjacent to Armstrong College.

The Newcastle-upon-Tyne Dental Hospital and School has recently become a component part of, and now constitutes the dental department in, the College. A new dental hospital, erected within the grounds of the Royal Victoria Infirmary and equipped on the best modern lines, is to be opened at the commencement of the forthcoming academic year, and in future it will be possible to undertake the whole of the dental curriculum (that is, systemic lectures, dental and general hospital practice, together with mechanical pupilage) at the College. The Dental Board of the United Kingdom will recognize the school for the purpose of granting its bursaries to students who are able to comply with the conditions laid down by the Board.

Post-Graduate Instruction.—A comprehensive series of post-graduate courses has been arranged to enable practitioners to take advantage of the facilities for laboratory work and clinical study which are afforded by the College, the Royal Victoria Infirmary, and other associated hospitals; and in order to meet the varied requirements of practitioners there are general and special courses in the winter and summer sessions, as well as an intensive course in the summer vacation. The courses of instruction for the B.Hy. and D.P.H. are suspended for the year 1931–32.

Students' Union.—A Students' Union has been erected and furnished at a cost of over £54,000, and is in daily use. Separate accommodation (non-residential) is provided for men and women students.

Appointments.—Pathological assistants, and assistants in the eye department, throat and ear department, and department for skin diseases, are elected periodically. Clinical clerks and dressers are appointed every three months. Resident appointments at the Infirmary are made every six months, and each year medical and surgical registrars (who also act as tutors) are appointed from candidates who have previously held resident appointments at any recognized hospital. These latter posts afford an excellent opportunity for post-graduates, not only at the Infirmary, but also in the departments of anatomy, physiology, pathology, and bacteriology of the College.

Scholarships.—University of Durham Entrance Scholarship, £25 a year for four years; Pears Entrance Scholarship, £40 a year for three years (awarded every third year); Heath Entrance Scholarship (from Kepier Grammar School), £60 (renewable); Province of Durham Masonic (Entrance) Scholarship, £60 (renewable); Heath Scholarship for surgery, £200, available every second year; Rutherford Morison Surgical Scholarship, £180, available every third year.

The following scholarships are tenable for one year—namely: Tulloch Scholarship for elementary biology and organic chemistry, £20; Dickinson Scholarship for medicine, surgery, midwifery, and pathology, Gold Medal and £20; Charlton Scholarship for medicine, £25; Gibb Scholarship for pathology, £28; Luke Armstrong Scholarship for comparative pathology, £25; Stephen Scott Scholarships for anatomy and physiology, two of £50 each; Philipson Scholarships for highest marks in Final M.B., B.S. Examination, two of £48 each; Goyder Memorial Scholarship for clinical medicine and clinical surgery, interest on £325; Hamilton Drummond Memorial Scholarship, in aid of research in clinical surgery, about £50; Gibson Prize for midwifery and diseases of women and children, £10; Turnbull Prize and Silver Medal for surface anatomy; Outterson Wood Prize for psychological medicine, £10; and Sewell Memorial Prize and Silver Medal for clinical pathology.

Fees.—The composition fee for lectures for medical students at the college is £140. Composition fee for hospital practice, £46, plus £2 2s. yearly for three years, payable to the Committee of the Royal Victoria Infirmary. For dental students the composition fees amount to £261 for the B.D.S. and to £241 for the L.D.S., covering all systematic lectures and laboratory work at the College, general and dental hospital practice, and mechanical pupilage. Other information should be sought from the Dean of the College, University of Durham College of Medicine, Newcastle-upon-Tyne.

Leeds

The School of Medicine—which is open to both male and female students—in this city forms the teaching centre of the Medical Faculty of the University of Leeds, and is situated in immediate proximity to the General Infirmary, where students sufficiently advanced receive their clinical instruction. The buildings were opened in 1894, and contain excellent dissecting rooms, well-arranged laboratories for physiology, pathology, and bacteriology, three lecture theatres, and several similar classrooms. In addition, there are a library and reading room and museums of pathology and anatomy. The comfort of the students is secured by means of common rooms and a refectory. Extensions of the medical school buildings were opened in October, 1930, and an Institute of Pathology is in course of erection on an immediately adjacent site. The General Infirmary has 632 beds, and includes gynaecological and ophthalmic wards, special children's wards, and a large out-patient department. The Ida and Robert Arthington Semi-convalescent Hospitals, Cookridge, attached to the Infirmary, have 88 beds. The West Riding Mental Hospital at Wakefield is available for the study of mental diseases. Students can, in addition, attend the practice of the Leeds Public Dispensary, the Hospital for Women and Children, and the Leeds Maternity Hospital.

Appointments.—Physicians' clerks and surgical dressers are appointed every six months; clerks in the children's department, orthopaedic dressers, ophthalmic and aural dressers, gynaecological ward clerks, maternity clerks, assistant physicians' clerk, dermatological clerks, assistant surgeons' dressers, dressers in the casualty rooms, junior and senior post-mortem clerks, laboratory assistants and dressers in the venereal clinic every three months. After graduation a considerable number of resident and other appointments become available in the Leeds General Infirmary, Leeds Public Dispensary, Hospital for Women and Children, West Riding Mental Hospital, etc., occupying periods of from six to twelve months at rates varying from £20 to £150 per annum.

Scholarships.—The university awards annually on the results of the first examination a scholarship in the form of free admission to the lectures and classes given in the School of Medicine. The university also awards a scholarship on the results of the second examination, of the value of £68, in the form of free admission to the clinical teaching of the Infirmary.

Fees.—It is estimated by the authorities that the approximate cost of medical education to a student in this university is £324, *plus*, of course, the expenses of living during the five and a half years covered by the curriculum. The composition fee for the course for the first, second, and third examinations, and for the clinical work at the Infirmary, is £242. The composition and clinical fee for those who have passed the second examination is £156.

Further information can be obtained from the Academic Subdean or Clinical Subdean, School of Medicine, Leeds.

Liverpool

The Medical School of this city is part of the university, and, owing to the enlightened liberality of several men of wealth, is exceptionally well provided with special laboratories, as well as with ordinary spacious and well-equipped classrooms and laboratories for the instruction of students proceeding to medical degrees and diplomas in special and ordinary subjects. All the laboratory and other rooms are situated close to one another and intercommunicate, together forming large blocks of buildings. The work of students throughout all stages of their career is arranged upon very satisfactory lines, and the teaching hospitals, of which a list is given below, have amalgamated to form the clinical school of the university.

The nature of the appointments open to past and other students at this school will be gathered from the account which follows of the hospitals forming its clinical department.

Scholarships.—The awards made each year to successful students total over £1,500. *They include the following:* Two Holt Fellowships, one in pathology, the other in physiology; a Robert Gee Fellowship in anatomy; two John Rankin Fellowships in anatomy; a John W. Garrett International Fellowship in bacteriology; a Johnston Colonial Fellowship in biochemistry; an Ethel Boyce Fellowship in gynaecology; and a Thelwall Thomas Fellowship in surgical pathology; one Lady Jones Fellowship in orthopaedic surgery (value of Fellowships: two at £200, two at £150, two at £120, four at £100); a University Scholarship of £50, awarded on the results of the Final M.B. Examinations; a Ridgway Research Scholarship (£100); a Scholarship in mechanical dentistry of £20; two Lyon Jones Scholarships, of the annual value of £21 each for two years, one for the junior and the other for the senior students; the Derby Exhibition of £15; the Clinical School Exhibition of £15; the Owen T. Williams Prize; the Torr Gold Medal in anatomy; John Rankin Exhibition in practical anatomy, £25; the George Holt Medal in physiology; the Kanthack Medal in pathology; Mitchell Banks Medal in anatomy; the Robert Gee Prize of £5 5s. in children's diseases; Mary Birrell Davies Memorial Scholarship (women), £60 per annum for four years; Robert Gee Entrance Scholarship (men), value of £42 10s. per annum for four years; Dental Operating Prizes (four); Orthodontia Prizes (two); Samuels Memorial Scholarships, three at £20 each; one Thomas H. Bickerton Prize in anatomy; Dr. N. E. Robert Prize in zymotic diseases; Ash's Prize in dental surgery, value £2 2s.; Gilmour Medal; and other entrance scholarships. In addition, a number of gold and silver medals have recently been instituted in the following subjects: pharmacology, surgery, forensic medicine and toxicology, medicine, orthopaedic surgery, and laryngology and otology.

Fees.—Information as to the fees for the courses of instruction provided by the schools should be sought from the Dean of the Medical Faculty.

The Clinical School

As many as nine hospitals have combined to form the clinical school of the university, these being: The Royal Infirmary, the David Lewis Northern Hospital, the Royal Southern Hospital, the Stanley Hospital, the Royal Liverpool Children's Hospital, the Hospital for Women (with the Samaritan Hospital), the Liverpool Maternity Hospital, the Eye and Ear Infirmary, and St. Paul's Eye Hospital. Between them they provide over 1,500 beds.

Manchester

The staff of the Medical School in this city constitutes the Medical Faculty of the Victoria University, all the arrangements for the instruction of students, both in their earlier and their later studies, being of an elaborate nature. The clinical work of the undergraduates is done chiefly in connexion with the Royal Infirmary, an institution which itself contains 590 beds, and has associated with it a large convalescent home (132 beds) and a Central Branch Hospital (54 beds). The courses in mental diseases are partly taken in the County Mental Hospitals at Prestwich and Macclesfield. Instruction in practical gynaecology and midwifery is given at the Royal Infirmary and the St. Mary's Hospitals.

Appointments.—The following are among the appointments open to past and present students of this school in connexion with its arrangements for clinical tuition: Two surgical registrars at £150 per annum; two pathological

registrars, at £100 and £50 per annum, one medical registrar, at £150 per annum, a cardiographic registrar, at £150 per annum, a surgical tutor, at £30 per annum, a director of the clinical laboratory, at £400 per annum, and two assistants, at £350 and £300, three assistant medical officers and three assistant surgical officers, each at £35 per annum, assistant surgical officers, aural department, at £35 per annum, seven anaesthetists, from £75 to £125 per annum each, one resident medical officer, one year, £200 per annum, one resident surgical officer, one year, £200 per annum, three resident medical officers for Central Branch, one at £200 and two at £100 per annum, one assistant resident surgical officer, £150 per annum, one resident medical officer at the Convalescent Hospital at Cheadle £250 per annum, two assistant medical officers to radiological department, £150 and £105 per annum, medical officer, physiotherapeutic department, £150 per annum, assistant surgical officer, gynaecological department, £35 per annum, assistant to the dermatologist, £20 per annum, and three assistant surgical officers for Central Branch, £75 per annum, ten house surgeons and eight house physicians, appointed during the year for periods of six months, at a salary of £50 per annum Resident officers are appointed to the gynaecological eye, and the ear and throat departments every three months Clinical clerks and surgical dressers are appointed to the various departments of the hospital every three months Non resident clinical assistantships for qualified medical men and women, tenable for six months, at an honorarium of £35

Clinical work.—The Royal Eye Hospital, the Hospital for Diseases of the Skin, the Manchester Northern Hospital for Women and Children, the well known Hospitals for Children at Pendlebury, and St Mary's Hospitals for Women and Children, the Manchester Hospital for Diseases of the Ear, Monsall Fever Hospital, the Christie Cancer Hospital, the Hospital for Consumption and Diseases of the Throat and Chest, the Ancoats Hospital, and the Salford Royal Hospital, all make arrangements for the instruction of students

Entrance and other Scholarships.—The following are among the scholarships obtainable by students of the school Rogers and Scatton Scholarships in Arts (in alternate years) £40 per annum tenable for two years Three Hulme Scholarships tenable for three years of £35 one being awarded annually for proficiency in subjects of general education Two James Gaskill Scholarships of £35 tenable for two years one being awarded annually for proficiency in the branches of mechanics and chemistry A Dora Muir Scholarship £30 per annum tenable for three years and open to the competition of women students only This is awarded triennially Sir J P Hay Shuttleworth Scholarship £30 per annum tenable for three years awarded triennially open to the competition of scholars from Sedbergh School Giggleswick School and Burnley Grammar School subjects—mathematics chemistry and mechanics Dreschfield Memorial Scholarship value £20 tenable for two years and awarded triennially on the result of the Entrance Examination John Russell Medical Entrance Scholarship awarded annually value £45 Two Dauntesey Junior Medical Scholarships value £50 each tenable for one year for candidates who have not commenced the second year of study leading to a medical qualification subjects—zoology, botany and chemistry One Dauntesey Senior Medical Scholarship £50 for one year awarded on results of Second M B Examination Two Entrance Scholarships in medicine value 160 guineas awarded annually for proficiency in arts or science respectively Tom Jones Exhibition in anatomy £25 offered annually A Robert Platt Physiological Scholarship of £90 tenable for one year A Leech Fellowship of £100 for original research after graduation A Graduate Research Scholarship in medicine value £70 tenable for one year awarded annually for proficiency shown at Final M B Examination A Dumville Surgical Prize value £15 awarded annually at graduation The Tom Jones Memorial Surgical Fellowship value £105 tenable for one year usually awarded annually The Turner Medical Prizes value 10 guineas each awarded annually for proficiency in certain subjects of the Final M B Ch B Examination The John Henry Agnew Prize of £30 awarded annually for proficiency in the diseases of children The Ashby Memorial Scholarship tenable for one year (£100) for research in the diseases of children offered triennially Sidney Renshaw Prize in physiology one offered annually (£15) Wild Prize in pharmacology (£10) The John Henry Agnew Fellowship in diseases of children £120 offered triennially Eliza Marple Holt Post Graduate Medical Scholarship for Women £60 for one year offered biennially. The details and regulations of the Dickinson Scholarships—(1) for anatomy (2) for pathology (3) Research Scholarship in surgery and (4) Travelling Scholarship in medicine—may be obtained from the Secretary to the Trustees The Morrison Watson Fellowship for research in anatomy is offered annually, value £150 also the Sheridan Delepine Fellowship in preventive medicine value £300 is offered biennially The Sam Gamble Scholarships—the trustees are prepared to award four scholarships of not less than £40 per annum tenable for not more than four years to women students who have passed the First M B Examination the conditions can be obtained from the Registrar The Knight Prize of £50 for original research in the psychological factors in the causation of mental disorder —open to holders of the Diploma in Psychological Medicine or medical practitioners who have been registered in the university as candidates for that diploma

Fees.—The composition fee for the university course in medicine is 114 guineas for men 112 guineas for women, payable in four instalments of 28½ and 28 guineas respectively, but this sum does not include the fee to cover the work required for the First M B Examination This is £42 payable in one sum Hospital fees are additional and usually amount to about 77 guineas

A prospectus and further information about the school and scholarships may be obtained from the Registrar

Sheffield

In this city the Medical School is one of the departments of the university, being conducted and controlled by its Medical Faculty, and occupying practically the entire north wing of the quadrangle of the university buildings overlooking Weston Park The laboratories and lecture rooms connected with the subjects of the first and second examinations—namely, chemistry, physics, biology, anatomy, and physiology—are, both as regards structural arrangement and scientific equipment, on the most modern and complete lines

For students of pathology and bacteriology there are laboratories replete with everything necessary for the most advanced work and a large pathological museum, which is open daily In addition, there is a large library and reading room There are a number of recreation, athletic, and other societies, all under the management of an annually elected students representative council and large and comfortable common rooms for both men and women students There are also two student unions—one for men and one for women students In the university buildings there is a refectory open to all students of the school, and a university journal is published each term The ordinary clinical work of the school is done at the Royal Infirmary and Royal Hospital, which have amalgamated for the purpose of clinical instruction, and provide over 800 beds for medical, surgical, and special cases, including diseases of the eye

In addition, the Royal Infirmary has special departments for the treatment of diseases of the skin and ear, with beds assigned to them, whilst at the Royal Hospital there are special out patient departments for diseases of the throat, ear, skin, orthopaedics, and mental diseases The medical and surgical staffs attend daily, and give clinical instruction in the wards and out patient rooms Clinical lectures in medicine and surgery are given weekly Instruction in the practical administration of anaesthetics is given at either institution by the anaesthetists, and the post mortem examinations at both institutions are in charge of the Professor of Pathology and afford ample material for study of this subject Students are able to attend the practice of the Jessop Hospital for Women and the Hospital for Sick Children while special courses on fever are given at the City Fever Hospital, and on mental diseases at the South Yorkshire Mental Hospital

Appointments.—The following appointments are open to all students who have passed their examinations in anatomy and physiology (1) casualty dresserships (2) surgical dresserships (3) medical clerkships (4) pathological clerkships (5) ophthalmic clerkships, (6) clerk to the skin department etc These appointments are made for three months commencing on the first day of October, January April and July

Scholarships.—Entrance Medical Scholarship covering cost of tuition fees for a degree course in the Faculty of Medicine,

open to both sexes. Six Edgar Allen Scholarships of £125 a year for three years may be held by students taking the degree course in medicine. Two Town Trustees' Scholarships, each of the value of £50 a year, tenable for three years, for boys or girls under the age of 19 years who have been educated in a Sheffield secondary school for a period not less than two years immediately preceding the examination. Four Town Trustees' Scholarships, value £50 a year, for boys or girls under 19 years of age educated in any school in Sheffield, secondary or otherwise. Town Trustees' Fellowship, value £75, tenable for one year. Mechanics' Institute Fellowship, value £50 (with remission of fees), tenable for one year, and renewable for a second year. The Frederick Clifford Scholarship, value about £50, tenable for two years. Kaye Scholarship for proficiency in anatomy and physiology. Gold and bronze medals are also awarded for proficiency in various subjects.

Fees.—Students in the Faculty taking their complete medical course in the university pay an inclusive composition fee of £42 for each of the first five years and £28 for the sixth year. The composition fees for the dental courses are as follows: for B.D.S., first and third years, £80; second, fourth, and fifth years, £30; for L.D.S., first and second years, £80; third and fourth years, £30. The fees for special courses taken separately can be ascertained by inquiry of the Dean.

The Welsh National School of Medicine

The next session opens on October 1st. All classes are open to both men and women students. Particulars relating to the admission of students as from October 1st, 1931, can be obtained on application to the Provost, or to the Secretary, Welsh National School of Medicine, The Parade, Cardiff.

The following is a list of heads of departments: Physics, Professor R. T. Dunbar; chemistry, Professor W. J. Jones; zoology, Professor W. M. Tattersall; botany, Professor R. C. McLean; anatomy, Professor C. McLaren West; physiology, Professor T. Graham Brown; materia medica and pharmacology, Dr W. Mitchell Stevens; pathology and bacteriology, Dr. J. B. Duguid; medicine, Professor A. M. Kennedy; surgery, Professor A. W. Sheen; obstetrics and gynaecology, Professor Sir Ewen J. Maclean; preventive medicine, Professor Edgar L. Collis; tuberculosis, Professor S. Lyle Cummins.

SCOTLAND

As will be gathered from the following paragraphs, the facilities for acquiring a medical education in Scotland are very ample, whether the student be proceeding to a university degree or to a diploma. To the descriptions of the different Scottish medical centres is in some cases added an account of hospitals which either play an official part in the education given to students as yet unqualified, or offer valuable opportunities for post-graduation work.

Aberdeen

The school is conducted by the Faculty of Medicine. This comprises thirteen chairs, from which instruction is given in all the main branches of medical science—namely, biology, physics, chemistry, anatomy, physiology, materia medica, pathology, bacteriology, forensic medicine, surgery, medicine, and midwifery. Courses of instruction in public health and infectious diseases, tropical medicine, medical ethics, tuberculosis, and clinical methods are conducted by lecturers appointed by the University Court. Special opportunities for practical instruction are afforded in the laboratories and museums attached to the departments.

Clinical instruction is obtained in the Royal Infirmary (accommodating 370 patients), the Royal Mental Hospital (900 patients), the Sick Children's Hospital (132 patients), the City Fever Hospital (350 patients), the General Dispensary, Maternity, and Vaccine Institution (10,000 out-patients annually), and the Ophthalmic Institution (3,000 patients annually). Courses of practical instruction are given in diseases of children at the Sick Children's Hospital; in fevers at the City Fever Hospital; in mental diseases at the Royal Mental Hospital; in diseases of the ear, nose, and throat at the Infirmary and Dispensary; in diseases of the eye at the Infirmary and Eye Institution; in venereal diseases and diseases of the skin at the Royal Infirmary.

The degrees granted in medicine are: Doctor of Medicine (M.D.), Master of Surgery (Ch.M.), Bachelor of Medicine and Bachelor of Surgery (M.B., Ch.B.). A diploma in public health is conferred after examination on graduates in medicine of any university of the United Kingdom.

The degree of Ph.D. is also granted in this faculty.

Bursaries, scholarships, and fellowships, to the number of fifty, and of the annual value of £1,200, may be held by students of medicine in this university. They range from £8 to £150 per annum, and are tenable in most cases for two or three years. The winter session begins on October 13th, 1931; the summer session on April 19th, 1932.

Fees.—An inclusive fee of 126 guineas is payable for instruction within the university, and the fee for the degrees of M.B., Ch.B. is 33 guineas. The total cost, including hospital fees, class and matriculation fees, and degree fees, is about £240.

Edinburgh

There are two Schools of Medicine: the School of the University, and the School of Medicine of the Royal Colleges of Physicians and Surgeons of Edinburgh.

THE UNIVERSITY SCHOOL.—This school, in addition to other resources of the university, has the following means of affording practical instruction: Royal Botanic Garden, Herbarium, and Museum; zoological laboratory and museum of science and art; physical laboratory; chemical laboratories; dissecting room, bone room, and anatomical museum; physiological laboratory; medical jurisprudence laboratories; John Usher Institute of Public Health; materia medica museum and laboratory; post-mortem department of the Royal Infirmary and University Pathological and Bacteriological Laboratory; tutorial classes of practice of physic, of clinical medicine, and clinical surgery, surgery and midwifery; and the practice of certain other hospitals.

Fees.—The sessional fee for chemistry, anatomy lectures, physiology, pathology, materia medica, surgery, medicine, and midwifery is £6 6s. each. Physics, botany, zoology, forensic medicine, and public health, £5 5s. Practical zoology, practical anatomy (summer), morbid anatomy, practical materia medica, mental diseases, practical pathology, clinical midwifery, and medical entomology and parasitology, £4 4s. Experimental physiology, diseases of tropical climates, practical botany, histology, operative surgery, clinical surgery (per term), clinical medicine (per term), and experimental pharmacology, £3 3s. Practical anatomy, (winter), £6 16s. 6d. Practical chemistry, £4 14s. 6d. Regional anatomy, chemical physiology, surgical pathology, and infectious diseases, £1 11s. 6d. Tuberculosis, diseases of children, diseases of the eye, diseases of the larynx, ear, and nose, diseases of the skin, and venereal diseases, £2 12s. 6d. Advanced bacteriology, £7 17s. 6d. Clinical gynaecology and applied anatomy, £2 2s.

Scholarships.—There are many funds for the assistance of students by means of bursaries, scholarships, exhibitions, and money awards from the beginning to the end of their undergraduate career. In addition, there are funds which help those who have taken a first degree in medicine and surgery to continue at work as research students. The value of these awards, and the conditions attaching to them, are so varied that those interested should consult the prospectus of the school itself. No other university is in a better, even if as good, position to smooth the financial path of earnest students.

THE SCHOOL OF MEDICINE OF THE ROYAL COLLEGES.—This school is composed of lecturers licensed by the Royal College of Physicians and the Royal College of Surgeons, and also recognized by the university through their *licentia docendi*; for the sake of convenience they lecture in separate buildings near to the Royal Infirmary, but form a single corporate body governed by a board elected by the Royal Colleges of Physicians and Surgeons and by the lecturers. This board, with the assistance of the standing committees of the school, supervises the whole management and especially the maintenance of the efficiency and discipline of the school. The different buildings at present utilized for the purposes of lecturing

are the following (1) Surgeons' Hall, Nicolson Street, (2) New School, Bristo Street, (3) Nicolson Square, (4) Marshall Street, and other places The teaching is similar to that of the Scottish universities, and the students receive similar certificates at the close of each session The courses on the special subjects are also conducted by teachers specially qualified in each branch, and have for the last quarter of a century formed a special feature of the school The fees payable for class and other instruction, and including the sums payable on admission to the examination of the Conjoint Board for the triple qualification, amount to about £180 The Calendar, giving full information regarding classes and fees, can be obtained (price 6d) on application to the Dean of the School, Surgeons' Hall, Edinburgh

WOMEN STUDENTS IN EDINBURGH.—Until the close of the summer session of 1916 women students intending to proceed to graduation in the University of Edinburgh, as well as those entering for the triple qualification of the Royal Colleges of Edinburgh and Glasgow, received their training in the Edinburgh School of Medicine for Women Now women students study under the same conditions as men, and may obtain either the university degree or the diploma of the Royal Colleges In the university systematic lectures are given to them by the professors in the ordinary classes, which are therefore mixed In clinical surgery, however, while the lectures are attended by mixed classes, the women students are restricted to the wards of one charge The particular wards are changed every six months, each of the surgeons to the Infirmary taking the women students in rotation With few exceptions, prizes, scholarships, bursaries, and similar distinctions are open to women under the same conditions as for men The women students also have the same privileges as in the past have been given to the men of attending a certain proportion of the extra mural classes taught by the lecturers of the School of Medicine of the Royal Colleges Most of the students societies are open to women, with the exception of the University Union and the Royal Medical Society Their place is taken by the Women Students' Union and the Women's Medical Society There is also a Women's Athletic Club, with playing fields gifted to it by the university The membership of the Royal College of Physicians and Fellowships of the two Royal Colleges are also open to women Information on matters connected with women's studies may be obtained from the Adviser of Women Students, The University, Edinburgh

Glasgow

THE UNIVERSITY SCHOOL FOR MEN.—The whole course of study required for graduation (M B, Ch B) at the University of Glasgow can be taken here Besides ample provision for lectures there is practical and clinical work at the hospitals, and practical courses are conducted in the laboratories of the following departments pathology, public health, pharmacology, physiology, surgery, anatomy, chemistry, zoology, physics, and botany, the Botanic Garden and the Hunterian Museum are also open to students Well equipped new buildings have been provided for botany, zoology, practical anatomy, and operative surgery, as well as for pathology, the very large additions made a number of years ago to the chemical laboratory render it one of the most extensive in Scotland The classrooms and laboratories for the departments of physics physiology, pharmacology materia medica, medical jurisprudence, and public health are also of recent erection and are elaborately equipped In addition to the regius chairs and the chair of pathology at the University there are chairs of medicine, surgery, obstetrics, and pathology at the Royal Infirmary, and a number of university lectureships in clinical medicine, clinical surgery venereal diseases, laryngology, dermatology otology, psychological medicine, tuberculosis, pathological biochemistry and electrical diagnosis and treatment have been founded there Other chairs have been founded at the university in bacteriology, organic chemistry, physiological chemistry, applied physics, public health, and paediatrics There are also lectureships on the surgical and medical diseases of children and on electrical diagnosis and therapeutics The university, in short, has made great and successful efforts to extend and improve the accommodation of the medical departments, to strengthen the teaching staff, and to encourage post graduation and research work A diploma in public health is now also granted Three very extensive general hospitals in the city afford exceptional opportunities for clinical instruction—namely, the Western Infirmary (600 beds), near the university, to which the Regius Professors are attached, the Royal Infirmary (782 beds), and the Victoria Infirmary (380 beds), while the Royal Mental Hospital Gartnavel (500 beds), the Royal Hospital for Sick Children (290 cots), the Royal Maternity and Women's Hospital (114 beds), the Glasgow Eye Infirmary (100 beds), the Ophthalmic Institution (35 beds), the fever hospitals at Belvidere (680 beds), Ruchill (540 beds), and Mearnskirk, and other institutions afford facilities for the practical study of special branches The large general hospitals of the parish council are now also available for clinical instruction in medicine and surgery Information regarding post graduate study will be found at page 458

Bursaries.—Bursaries confined to the Medical Faculty amount in annual value to about £1 000 while bursaries in any faculty amounting to about the same annual sum may be held by students of medicine a number of both sets being open to women Several valuable scholarships may be held by medical students who have graduated in arts

The following bursaries are open for competition to students entering on their first session of attendance in the Faculty of Medicine Davidson Bursary annual value £40 tenable for four years for students who propose before entering the Faculty of Medicine to take the degree of B Sc in pure science including in their curricula anatomy and physiology Highland Society (Glasgow) Bursaries annual value £25 each, tenable for five years, for students of Highland descent open to women, two bursaries vacant each year Logan Bursary, annual value £25, tenable for four years open to women Robina Eckford MacBrayne Scholarship annual value £50 tenable for three years Marshall Bursary annual value £24, tenable for four years Merchants House Bursary, annual value £35 tenable for four years open to women John Oliphant Bursary annual value £35 tenable for six years James A Paterson Bursaries three each year of the annual value of £35 £25 and £15 respectively each tenable for four years students entering their second session are also eligible, open to women examination in mathematics and natural philosophy

Candidates for the aforementioned bursaries must take the university general bursary competition which is held each year in the month of June

In addition the following bursaries scholarships, and prizes are open to students prosecuting their studies in the Faculty of Medicine Arbroath Bursary, annual value £40, tenable for three years, is awarded by the Senate, on the recommendation of the Faculty of Medicine to the student who is of the highest merit among the candidates as shown by their class records and their performances in the First and Second Professional Examinations Arthur Bursary annual value £20, tenable for three years awarded to the *woman* student who takes the highest place among the Queen Margaret College candidates at the First Professional Examination Mary Allan Bell Bursaries (five), annual value £50 each tenable for three or four years, for students who have gone through the curriculum in arts, special examination, tenable also in theology or law Brisbane Bursary annual value £50 tenable for four years, candidates must be under 22 years of age and must have taken the degree of M A William Gardiner Bursary annual value £18 tenable for two years awarded on results of the First and Second Professional Examinations in the subjects of physiology chemistry and physics Dr Thomas Gibson Bursary annual value £50 tenable for four years, open to medical students entering on their second winter who are preparing for service as medical missionaries Johnston Bursaries (two) annual value £25 each tenable for three years for eminence in the work and examinations of the first and second years of the curriculum Lorimer Bursaries (six) value £20 each tenable for one year are awarded to the best students in each of the following classes botany zoology physics chemistry anatomy physiology Macfarlane Bursary annual value £40 tenable for three years for students who have attended the first session of their professional study in the university examination in elementary anatomy elementary chemistry and botany Mackintosh Bursary value £31 tenable for one year open to medical students of either sex who have attended one of the courses of lectures on insanity examination in that subject John

Monteith Bursary, annual value £21, tenable for two years, is awarded annually to the student who gains the highest number of marks in the subjects of anatomy and physiology at the professional examinations held during the previous year. Rainy Bursary, annual value £50, tenable for two years, for students entering on their third session of medical study; awarded to the candidate whose aggregate of marks in the subjects of anatomy and physiology of the Second Professional Examination, and in chemistry, botany, and zoology of the First Professional Examination, is the highest. A. and B. Stewart Bursaries, annual value £50 each, tenable for three years, for students who have gone through the arts curriculum; there is a special examination. Walton Bursary, annual value £40, tenable for four years; the Earl of Sandwich has the right of appointing to the bursary one of two students nominated by the Senate. Weir Bursary, value £25, tenable for one year, awarded on the results of the Second and Third Professional Examinations. Barbour Scholarship in anatomy or physiology, annual value £250, tenable for two years. Joseph Coats Memorial Scholarship, value £85, tenable for one year, for research in pathology, may be held concurrently with the Perman Memorial Scholarship (q.v.). Faulds Fellowship, annual value £250, tenable for three years, for medical research. Foulis Memorial Scholarship in pathology, value £50. Four McCunn Medical Research Scholarships, value £200 each, tenable for one year. Perman Memorial Scholarship, value £50, tenable for one year, for research in pathology, may be held concurrently with the Joseph Coats Memorial Scholarship (q.v.). The Junior Arnott Prize of about £15; the Senior Arnott Prize of £25. Three Bellahouston Gold Medals. The Brunton Memorial Prize of about £20. The Macewen Medal in surgery. The Captain H. S. Ranken V.C. Memorial Prize of £5. The Straits Settlements Gold Medal. The West of Scotland R.A.M.C. Memorial Prize of about £15.

The Carnegie Trust for the Universities of Scotland is empowered to pay the whole or part of the university ordinary class fees of students of Scottish birth or extraction, under conditions given in the University Calendar, and summarized at page 432 of this issue. Scholarships and Fellowships are offered by the Carnegie Trust in science and medicine for post-graduation study.

Fees.—The matriculation fee for each year is £2 12s. 6d. In most cases the fee for each university class is £6 6s., but in some cases it is £4 4s. For hospital attendance at the Western Infirmary students pay £12 12s. for a perpetual ticket, or £1 11s. 6d. for a single term ticket, with an additional fee of £5 5s. for each winter and £2 12s. 6d. per term for each clinical course. The fees are the same at the Royal Infirmary. The university fees for the four professional examinations total £34 13s. For the whole curriculum the fees for matriculation, class attendance, hospital attendance, and professional examinations amount to about £250.

For further information apply to the Registrar, Glasgow University.

QUEEN MARGARET COLLEGE.—In this, the Women's Medical School of the University of Glasgow, the courses of study, degrees, regulations, fees, etc., are the same as for men. Women students have their own buildings, with classrooms, reading rooms, library, etc. They are taught in some classes apart from male students, in most together with them, but in either case have all the rights and privileges of university students. Their clinical studies are taken in the Royal Infirmary, the Western Infirmary, and the Victoria Infirmary; also *inter alia* in the Royal Hospital for Sick Children, the Glasgow Ear Hospital, the Royal Asylum, Gartnavel, Hawkhead Asylum, the Ophthalmic Institution, the City of Glasgow Hospitals, Belvidere and Ruchill, and the Glasgow Maternity and Women's Hospital.

Scholarships.—The Arthur Scholarship, annual value £2[illegible] tenable for three years. Open to competition by medical students of first year at the First Professional Examination in October, 1931. This scholarship is restricted to women medical students.

Full information can be obtained from the Mistress, Queen Margaret College, Glasgow.

Board for Students.—University halls of residence for women students, Queen Margaret Hall and Robertson Hall, are situated near the college. The cost of board and residence is from 35s. to 42s. a week, according to accommodation. Applications to be made to the Wardens. Another residence near the college is South Park House, Ann Street, belonging to the Student Christian Movement, and open to women students of all colleges in Glasgow. Cost of board is from 32s. to 35s. weekly. Applications to be made to the Warden.

ST. MUNGO'S COLLEGE.—This is the Medical School of the Royal Infirmary, which is the largest general hospital in Glasgow. The Infirmary is situated in Cathedral Square, Castle Street, and has car communication with every part of the city. St. Mungo's College is in the Infirmary grounds, and affords full courses in all the subjects of the medical curriculum, and in all the medical subjects of the dental curriculum.

The Infirmary has (including the ophthalmic department) 782 beds, 542 for surgical and 240 for medical cases. There are special beds and wards for diseases of women, of the throat, nose, and ear, burns, and septic cases. In the out-patient department in 1928 over 97,000 patients were treated. In addition to the large medical and surgical departments, there are departments for special diseases—namely, diseases of women, of the throat and nose, of the ear, of the eye, of the skin, and of the teeth. There is also a fully equipped electrical pavilion, with the latest and most improved apparatus for diagnosis and treatment.

Appointments.—Five house-physicians and eleven house-surgeons, who must be fully qualified, are appointed every six months, and board in the hospital free of charge. Clerks and dressers are appointed by the physicians and surgeons. As many cases of acute diseases and accidents of a varied character are received, these appointments are very valuable.

Fees.—The average class fee is £3 3s. for summer classes and £4 4s. for winter classes. The fees for all the lectures, practical classes, and hospital attendance necessary for candidates for the diplomas of the English or Scottish Colleges of Physicians and Surgeons amount to about £120. The classes are open to male and female students.

A syllabus of classes can be obtained on application to the Secretary to the Medical Faculty, St. Mungo's College, 86, Castle Street.

THE ANDERSON COLLEGE OF MEDICINE.—This school provides education in the subjects of the curriculum for both medical and dental students. The school buildings are situated in Dumbarton Road, immediately to the west of the University and Western Infirmary. The hospital practice and clinical lectures are provided in the Western or Royal Infirmary; pathology in the Western or Royal Infirmary; vaccination and dispensary practice in the Western or Royal Infirmary Dispensary. These classes are recognized by all the licensing corporations in the United Kingdom, also by the Universities of London, Durham, Glasgow, and Edinburgh (the latter two under certain conditions stated in the School Calendar).

Fees.—The fees for the lectures and practical work required by ordinary students range between 2 and 6 guineas a session. The Carnegie Trust pays the fees of students at Anderson College on conditions regarding which particulars may be obtained from the Secretary, Carnegie Trust Offices, Edinburgh.

A Calendar will be sent on receipt of a postcard by the Secretary to the Medical Faculty, the Anderson College of Medicine, Glasgow, W., who will forward any further information which may be desired.

The Royal Samaritan Hospital for Women, Glasgow, with 160 beds, offers facilities for clinical instruction in the diseases peculiar to women. A university lectureship, the Royal Samaritan Lectureship in gynaecology, is associated with the hospital. The lecturer is Dr. David Shannon. Particulars may be obtained from Mr. T. Mason Macquaker, M.A., Secretary, 200, St. Vincent Street, Glasgow.

St. Andrews and Dundee

The medical departments in these two teaching centres cater specially for students proceeding to the degrees of the University of St. Andrews, but admit other students as well. In the former city the United College provides education in all subjects for the first two years. In Dundee, University College provides for the needs of students from the beginning to the end of the five years' curriculum. Its buildings are modern, and contain fully equipped laboratories. The clinical work of the school is facilitated by various institutions. The class fees are from £6 6s. to £5 12s. 6d. for systematic classes, and from

14s. 6d. to £4 4s. for practical classes. The hospital ket is £1 8s. for three months, £4 4s. a year, or rpetual, £13 6s. 8d. in one sum. The inclusive or mposition fee for the curriculum is £182. In connexion th both institutions there are bursaries and scholarships considerable value, which are awarded after competitive amination. Information as to these can be obtained om the Secretary of the University of St. Andrews. formation regarding the clinical facilities may be tained from the Dean of the Medical Faculty, Medical hool, Dundee.

Clinical Work

Good opportunities for clinical work are afforded by the undee Royal Infirmary, the instruction given thereat eing recognized for purposes of graduation by all the cottish universities, the University of Cambridge, the niversity of London, the National University of Ireland, id by the Royal Colleges of England and Scotland.

IRELAND

here is a choice of six schools for those pursuing their edical studies in Ireland. For clinical instruction the noice is equally wide and varied, though the hospitals iemselves are comparatively small. Some account of the *hools follows.*

Dublin

School of Physic

his school is in Trinity College, Dublin, and is carried n under the joint auspices of the University of Dublin and f the Royal College of Physicians of Ireland, the King's rofessors of institutes of medicine (physiology), practice f medicine, materia medica, and midwifery being ap-ointed by the latter. Clinical instruction is given at Sir *'atrick Dun's Hospital, and some twelve other metro-*olitan hospitals and asylums are recognized by the Board f Trinity College. The courses of instruction are open o all medical students, whether they belong to the niversity or not.

The Schools of Surgery

These are schools carried on in Dublin under the super-ision and control of the Council of the Royal College of Surgeons. They are formed of the college's own school, combined with two famous old medical schools—Carmichael and Ledwich ; they are attached to the college by charter. The buildings contain spacious dissecting rooms, special pathological, bacteriological, public health, chemical, and pharmaceutical laboratories. Advantage can be taken of the lectures and instruction afforded by students otherwise unconnected with the college.

Prizes.—Among the prizes annually awarded are: The Barker Anatomical Prize (£26 5s.) ; the Carmichael Scholarship (£15) ; the Mayne Scholarship (£8) ; the Gold Medal in surgery ; the Stoney Memorial Gold Medal in anatomy ; the *H.* Macnaughton Jones Gold Medal for midwifery and gynaecology ; the Captain Massey Miles Memorial Prize ; class prizes, accompanied by silver medals, will also be given in each subject.

A prospectus can be obtained post free on application to the Registrar, Royal College of Surgeons, Dublin.

University College, Dublin

This is one of the constituent colleges of the National University of Ireland. The arrangements for the teaching of medical students from beginning to end of the curriculum are adequate. Applications for information may be addressed to the Secretary and Bursar, University College, Dublin.

Clinical Teaching in Dublin

There are numerous well-arranged hospitals in and around the city, and almost all of these are recognized for teaching purposes by the Conjoint Board of Ireland, the University of Dublin, the National University of Ireland, and by like bodies elsewhere in the British Isles. Among them are the Mater Misericordiae Hospital, with 345 beds ; Dr. Steevens's Hospital at Kingsbridge, with 150 ; Meath Hospital and County Dublin Infirmary, with 160 ; Mercer's Hospital, with 120 ; the Royal City of Dublin Hospital, with 124 ; the Adelaide Hospital, with 160 ; the Royal Victoria Eye and Ear Hospital, with 100 beds ; Sir Patrick Dun's Hospital, which has a direct connexion with the School of Physic, and the combined institutions formed by the Hardwicke Fever Hospital, the Richmond Surgical Hospital, and the Whitworth Medical Hospital, with an aggregate of 330 beds.

As for the famous Dublin medical institution known as the Rotunda Hospital, this practically consists of two distinct hospitals, and is believed to be the largest combined maternity and gynaecological hospital in the British Isles. There are ante-natal and paediatric departments as well as a thoroughly equipped pathological laboratory, and *x*-ray apparatus. It possesses residential quarters for students, and, taken as a whole, offers exceptional opportunities for study both to ordinary students and to medical graduates of any nationality. During the year 1929, 3,182 patients were admitted to hospital, this total being made up of 2,424 maternity cases and 758 gynaecological cases ; 1,793 patients were attended at their own homes and 11,041 attended the dispensary.

Two other important obstetric and gynaecological hospitals in Dublin are the Coombe Lying-in Hospital and the National Maternity Hospital. During the year ending December 31st, 1929, the number of cases dealt with in the Coombe Lying-in Hospital were as follows: intern maternity department, total admissions 1,204 ; intern *maternity department, total deliveries* 1,080 ; *extern* maternity department, total deliveries 1,432 ; gynaecological department, number of operations 361.

At the National Maternity Hospital, Holles Street, Dublin, 1,413 patients were admitted to hospital during the year ending March *31st, 1930* ; total deliveries in hospital were 961 ; gynaecological operations 371 ; and dispensary attendances 7,843.

The practice of these hospitals is attended by large numbers of students, post-graduates, and nurses.

Belfast

The Medical School is part of the Faculty of Medicine of Queen's University, Belfast, and provides a complete *medical curriculum for all purposes.* The laboratories in connexion with the departments of bacteriology, biochemistry, biology, chemistry, physiology, pathology, anatomy, physics, and materia medica are all excellent, and there is a students' union which gives students the advantages of dining rooms, reading rooms, a library, and various recreation rooms. Women are eligible as students. Clinical instruction is given at the Royal Victoria Hospital, which was rebuilt a few years ago and has 300 beds, and the Mater Infirmorum Hospital, which has 150 beds. Other hospitals open to the students of the university are: the Maternity Hospital ; the Ulster Hospital for Women and Children ; the Hospital for Sick Children ; the Ophthalmic Hospital ; the Benn Ulster Eye, Ear and Throat Hospital ; the Union Infirmary and Fever Hospital ; the Fever Hospital, Purdysburn ; the District Lunatic Asylum ; the Samaritan Hospital ; the Forster Green Hospital for Diseases of the Chest ; and the Belfast Hospital for Skin Diseases.

Scholarships.—(1) Eight, of the value of £40 each, are assigned as Entrance Scholarships in the Faculties of Arts, Science, and Medicine, tenable for one year ; (2) *fourteen* Professional Scholarships, value from £15 to £40 each ; (3) one Hutchinson Stewart Scholarship, £12, in mental diseases ; (4) one Mackay Wilson Travelling Scholarship, £100, awarded triennially ; (5) Isabella Tod Memorial Scholarship, tenable for three years, awarded triennially to a woman student ; (6) Magrath Clinical Scholarship, awarded annually, value about £112 ; (7) two Musgrave Studentships of £200 in physiology and pathology. There is also a post-graduate research *fund, open to all graduates of not more than three years'* standing. Gold medals are awarded at the M.D. examination.

Fees.—The cost of the curriculum intended for students proceeding to the degrees of the Queen's University of Belfast is, approximately, £200. This includes examination fees and a perpetual ticket for attendance at the Royal Victoria Hospital or the Mater Infirmorum Hospital, and fees for the special hospitals. The course for the Conjoint Board costs about the same amount.

The Regulations of the Medical Faculty, containing full information, can be obtained on application to the Bursar, *Queen's University, Belfast, price 4d.*

University College, Cork

This institution, formerly known as Queen's College, Cork, is one of the constituent colleges of the National University. It holds examinations for all the faculties of that university, in addition to continuing the work which it has hitherto performed—namely, that of providing education adapted to the needs of medical students at all stages of their career. Its first aim is to fit students for the degrees of the National University, but students proceeding for the examinations of the Conjoint Board of England, Scotland, or Ireland, the Society of Apothecaries of London or the Apothecaries' Hall of Ireland, or London University, can arrange the courses of lectures which they attend, and the order in which they attend them, to meet the requirements of those bodies. Certificates of attendance at the college courses are also accepted by the University of Cambridge. Clinical instruction is given at the North and South Infirmaries (each 100 beds) and at the Cork Union Hospital (1,200 beds). Students can also attend the Mercy Hospital (130 beds), the County and City of Cork Lying-in Hospital, the Hospital for Diseases of Women and Children, the Fever Hospital, the Ophthalmic and Aural Hospital, and the Eglinton Lunatic Asylum. The session extends from October to June.

There is a Dental School in which the degree of Bachelor of Dental Surgery of the National University of Ireland can be obtained. There is a large well-equipped dental hospital in connexion with the school.

Scholarships.—About £2,500 is available annually for scholarships in the college. Particulars as to each of them can be obtained on application to the Registrar.

Fees.—The fees for the lectures and hospital attendances required by the National University of Ireland course, including examination fees, come to about £170.

Further information can be found in the Calendar or obtained on application to the Registrar.

University College, Galway

This institution is one of the constituent colleges of the National University of Ireland, and includes Faculties of Art, Science, Law, Celtic, Engineering, Commerce, and Medicine. The college buildings are well lighted and well ventilated, and contain dissecting rooms, an anatomical theatre, and laboratories for the study of physiology, chemistry, physics, and other departments of medical science. For pathology and chemistry new laboratories are now provided. It has good grounds surrounding it, and there are many arrangements, such as a library, a college union, and an athletic union, for the benefit of those belonging to the Medical Faculty, as well as for students in other departments of the college. The clinical teaching, which is recognized as qualifying not only for the degrees of the National University, but for those of the London University and the diplomas of the various colleges in the three kingdoms, is carried on at the Galway Central Hospital and the Galway Tuberculosis Hospital. The Galway Central Hospital is a general hospital, and at the two hospitals students have ample opportunities of studying zymotic and chronic diseases. The Central Hospital has a special ward for diseases of children. Each year the governing body offers about £2,500, and the County Councils of Connaught offer about £3,500, in scholarships. These scholarships are tenable in any faculty. Additional information regarding these scholarships can be obtained on application to the Registrar, and to the Secretaries of the Connaught County Councils.

CLINICAL HOSPITALS IN ENGLAND

Many hospitals in Great Britain and Ireland, though not connected with any medical school, open their doors either to those who have yet to be qualified, to those who are doing post-graduation work, or to both. The facilities they offer for gaining practical clinical experience are very great, and should not be overlooked. Their honorary staffs commonly make a point of giving such instruction as opportunity offers, and at those situated in the larger towns there are often appointments as clinical assistants to be obtained. In addition, they all have to offer, at shorter or longer intervals, appointments for resident medical officers, house-physicians, and house-surgeons. These are usually paid offices, which may be held for periods varying from six months to a year, or even longer. Some of the hospitals situated in the great medical centres in the provinces, as well as in Scotland and Ireland, have already been mentioned in speaking of the medical schools in these localities, but it should be added that there are many other provincial hospitals where admirable work is done, and at which much valuable experience can be gained by both senior and junior students, and by those already qualified. Cases in point are the Royal Infirmary, Bradford, the Royal Sussex County Hospital, Brighton; the Royal United Hospital, Bath; the Kent and Canterbury Hospital, the Derbyshire Royal Infirmary; South Devon and East Cornwall Hospital, Plymouth; the Royal Albert Hospital and Eye Hospital, Devonport; the Royal Devon and Exeter Hospital; the West of England Eye Infirmary, Exeter; the Gloucestershire Royal Infirmary and Eye Institution; the Royal Infirmary, Leicester, the County Hospital, Lincoln; the General Hospital, Northampton; the Norfolk and Norwich Hospital; the General Hospital, Nottingham; the Royal Portsmouth Hospital, the Royal Berks Hospital, Reading; the Royal South Hants and Southampton Hospital; the Staffordshire General Infirmary, Stafford; the North Staffordshire Infirmary at Hartshill; the Royal Hants County Hospital, Winchester, the Wolverhampton and Staffordshire General Hospital, the County Hospital, York; and the Coventry and Warwickshire Hospital.

London Clinical Hospitals

As for the hospitals in the metropolis, so many of them take a share in the giving of clinical instruction that it is worth while to classify them.

Children's Hospitals.—There are at least seven of these the leader among them being the Hospital for Sick Children Great Ormond Street, which has 268 beds. There are also the East London Hospital for Children, Shadwell, with 136, the Queen's Hospital for Children, Bethnal Green, with 134, the Victoria Hospital for Children, Chelsea, with 130; the Belgrave Hospital for Children, which has a considerable out-patient department, and in-patient accommodation for 74 children, the Paddington Green Children's Hospital; and the Evelina Hospital for Sick Children, Southwark Bridge Road, with 78 beds. The largest and the oldest of the hospitals for both women and children is the Royal Waterloo Hospital for Children and Women, Waterloo Road, S.E.1.

Hospitals for Women.—Queen Charlotte's Maternity Hospital, Marylebone Road, with 100 beds and a residential college for medical students and practitioners, specializes in the teaching of midwifery. The first section of the new Queen Charlotte's Hospital in Goldhawk Road, Hammersmith, an isolation block of 30 beds for cases of puerperal fever and puerperal pyrexia, was opened in July, 1930. The City of London Maternity Hospital, City Road, with 71 beds also admits medical students and graduates to its practice. The Samaritan Hospital for Women, Marylebone Road, admits qualified practitioners as clinical assistants to both the in-patient and out-patient departments; demonstrations are given daily in both departments, the fees—payable in advance—being £3 3s. for three months; full particulars may be obtained from the secretary. In addition may be mentioned the Hospital for Women, Soho Square, whose teaching is confined to post-graduates in limited numbers, the Chelsea Hospital for Women, Arthur Street, Chelsea, and the Elizabeth Garrett Anderson Hospital for Women in Euston Road, the latter being in the nature of a general hospital so far as concerns the class of case treated.

Eye Hospitals.—The largest of these is the Royal London Ophthalmic Hospital (Moorfields), City Road, E.C.1, 138 beds. At this hospital 2,534 in-patients, 51,924 out-patients in 1929. At this hospital two complete courses of instruction are given during the year—October to February, and March to July—comprising the following subjects: (1) anatomy (including histology and embryology), (2) physiology, (3) optics (including physiological optics), (4) refraction classes, (5) methods of examination and use of the ophthalmoscope, (6) pathology and bacteriology, (7) ophthalmic medicine and surgery, (8) ophthalmoscopic conditions, (9) operative surgery, (10) practical pathology, (11)

tical bacteriology, (12) radiology, (13) physiotherapy (in-ing ultra-violet light, diathermy, and ionization), (14) slit-p microscopy. A fee of 35 guineas will admit the holder to all the lectures and classes, except those on physio-apy and slit-lamp microscopy. The fee of a perpetual et to attend the practice of the hospital is £5 5s ; for e or six months, £3 3s. , for two months, £2 2s. ; for month, £1 1s. Registered medical practitioners and ical students are eligible, under certain conditions, for posts of chief clinical assistant, clinical assistant, and or assistant There are also a number of salaried posts, nnual Clinical Research Scholarship of £50, and a biennial ord Edmonds Prize of £100. Clinical work begins each ning at 9 and operations at 10 o'clock. The course of truction is specially adapted to meet the requirements of e reading for the D.O.M.S and similar diplomas and ees in ophthalmology Further particulars may be ob-ed from the Dean of the Medical School Other eye hos-ls are the Royal Westminster Ophthalmic Hospital, now ult on a new site in Broad Street, High Holborn, and taining 84 beds ; the Royal Eye Hospital, Southwark, and Central London Ophthalmic Hospital, Judd Street, W.C.1, with about 40 beds , and the Western Ophthalmic Hos-l with 18 beds

ever Hospitals.—The London County Council has under its trol a number of institutions in and around London for the tment of the more serious zymotic disorders , it makes ial arrangements for the instruction of students in this ject, and grants certificates at the end of the courses ailed information should be sought from the Medical cer of Health, Special Hospitals Division, London County ncil, Victoria Embankment, E C 4.

Chest Hospitals.—The largest of these is the Brompton Hos-l for Consumption, which has 333 beds and a large sana-um at Frimley with 150 beds There is also the City London Hospital for Diseases of the Chest, Victoria Park, h 185 beds, and the Royal Hospital for Diseases of the st, City Road, with 85 beds, now amalgamated with the yal Northern Hospital, Holloway Road

Nose, Throat, and Ear Hospitals.—The institutions which fine their work to disorders of the throat, nose, and ear make special arrangements for the benefit of senior and t-graduate students They are the Metropolitan Ear, Nose, l Throat Hospital, Fitzroy Square , the Royal Ear Hos-al, Huntley Street, W C 1 (now the Ear, Nose and Throat partment of University College Hospital) , the Central ndon Throat, Nose and Ear Hospital, Gray's Inn Road , d the Hospital for Diseases of the Throat, Golden Square— last, which possesses 95 beds, being the largest of the four stitutions

Miscellaneous Special Hospitals.—Among these are the thlem Royal Hospital, recently transferred from Kenning-n to Monks Orchard, Eden Park, Beckenham, Kent, nch (like the Maudsley Hospital) confines its work to the eatment of mental diseases, and includes a department for rvous and early mental disorders , the Royal National thopaedic Hospital, Great Portland Street , St Peter's spital for Stone and Urinary Diseases, Henrietta Street, vent Garden , St Mark's Hospital, City Road, which votes itself to the treatment of diseases of the rectum, in-ding cancer and fistula , the National Hospital for Diseases the Heart in Westmoreland Street, W 1 , St John's Hos-tal for Diseases of the Skin in Leicester Square , the Hospital r Diseases of the Skin, Stamford Street, Blackfriars ; the rtional Hospital, Queen Square, W C 1, an institution pos-ssing 200 beds for neurological cases and a world-wide putation , and the West End Hospital for Nervous Diseases, Welbeck Street, W 1

Detailed information as to the teaching arrangements of ll these institutions may be obtained on application to eir secretaries

Women in Medicine

he regulations of the General Medical Council and of the arious universities and colleges set out in previous sections pply to women as to men.

Examinations

Women are admitted to all the medical examinations f the following qualifying bodies: all the universities of reat Britain and Ireland ; the Royal College of Physicians f London , the Royal College of Surgeons of England ; he Society of Apothecaries of London ; and the Conjoint Boards of the Colleges in Scotland and in Ireland. In addition, women are eligible for election as Fellows of the Royal College of Physicians of London and the Royal College of Physicians of Edinburgh.

Medical Education

In this country at the present time co-education is the general rule. The schools of the London hospitals have, however, so far shown themselves more conservative in this respect than the rest of the country.

In England the colleges connected with the universities of Birmingham, Bristol, Cardiff, Leeds, Liverpool, Manchester, Newcastle, and Sheffield admit women students as well as men, whilst in Scotland the universities of Aberdeen, St. Andrews, Edinburgh, and Glasgow also admit women. In Ireland all universities and colleges are open to them.

In London the only schools open to medical women students are the London School of Medicine for Women and, to a modified extent, University College Hospital and King's College Hospital, which last-named has again opened its doors to women students during the past year. It is felt that such a state of affairs can only be temporary, and hopes can be entertained that in the near future the principle of co-education will prevail in the capital.

At the present time it will be seen that the only co-education hospitals in London are University College and King's College. The number of women entrants is restricted, but they are given excellent opportunities whilst students, and also, in fair proportion, are given opportunities of post-graduate experience as residents, house-surgeons, house-physicians, and obstetrical assistants.

Number of Women Medical Students

Returns made to the University Grants Committee at the end of 1930 showed that the total number of full-time women medical and dental students attending university institutions in England, Scotland, and Wales during the past six years were.

	1924-25	1925-26	1926-27	1927-28	1928-29	1929-30
England ..	1,197	1,059	930	852	821	842
Wales	32	30	32	30	14	19
Scotland	431	313	274	264	270	275
Total ..	1,660	1,402	1,235	1,146	1,108	1,136

The corresponding total number of full-time male students of medicine, including dentistry, was 7,623 in 1929-30.

The London (Royal Free Hospital) School of Medicine for Women

The London (Royal Free Hospital) School was started for the training of women in medicine in the days before there were any co-education facilities for them, and it still remains by far the largest school for women In addition to the clinical work at the Royal Free Hospital, which at present has 280 beds, but will shortly have 360 when the extensions now in progress are completed, arrangements are made for students of the school to obtain clinical instruction at the National Hospital for Nervous Diseases, Queen Square ; the Royal London Ophthalmic Hospital, Moorfields , the Great Ormond Street Hospital for Children , the Elizabeth Garrett Anderson Hospital , the South London Hospital for Women , and the Cancer Hospital Its importance for women in medicine can hardly be overestimated, not merely because it was the pioneer which made the way possible, but also because it is still the only general hospital in Britain which offers all its post-graduate appointments, higher and lower, to open competition by women as well as men, thus giving unique opportunity of gaining experience. Not only are all the

resident appointments at the Royal Free Hospital, of which there are twenty-seven yearly, eligible for women, but, in addition, higher posts may be obtained in all the various branches of a general hospital, from those of registrar and anaesthetist to those of visiting physician or surgeon and those in charge of special departments. There is a special unit in gynaecology under a woman professor, and entirely staffed by medical women. This policy has so far not been fully adopted in its entirety by any other hospital, and it may be of interest to note in this connexion that the Royal Free Hospital has many women on its general committee and weekly board of management.

OPENINGS FOR MEDICAL WOMEN

There are at the present time the names of over five thousand medical women on the *Medical Register*. There is an increasing demand by the public for the services of women doctors in all branches of medicine, and statistics show that the number of those who make good is as high as, if not somewhat higher than, that of their men colleagues.

OPENINGS AT HOME

Since the number of men and women qualifying has reached normal standards, medical women on qualification find no difficulty in obtaining house appointments in the recognized teaching hospitals and in non-teaching hospitals, hospitals for women and children, sanatoriums, etc. In fact the supply at the present time does not meet the demand.

General Practice.—There are good openings as assistants or, better still, as assistants with a view to admission as partners in general practice. Medical women also do very well when starting in new districts; and there is considerable scope for them in midwifery work.

Specialist and Consulting Practice.—The number of women doing specialist and consultative practice grows rapidly. There is no branch of medicine in which it is not possible for a patient to consult a medical woman. Women so specializing equip themselves by obtaining the highest essential qualifications, and it is hoped that the time is not far distant when many more women will hold positions on the honorary staffs of all hospitals. Already medical women are on the honorary staff of the Royal Free Hospital, London, and of general hospitals in a number of provincial cities. In London, Edinburgh, Glasgow, Manchester, and Brighton there are hospitals staffed entirely by medical women, doing very fine work and meeting a real need, the latest to be opened being the Marie Curie Hospital in London for the treatment of cancer by radium. Research work also provides interesting openings, as, for example, in dealing with the special problems concerning cancer, nutrition, puerperal morbidity and mortality, statistical work, etc., and for some of these research scholarships and grants are available.

Teaching Posts.—Women hold professorships and lectureships at various universities.

Industrial Medicine.—In this branch there is much interesting work available, and it is undergoing considerable development at the present time. Several women already hold such posts.

Administrative Work.—A certain number of these important posts are admirably filled by medical women. At the Ministry of Health the chief medical officer for maternity and child welfare is a medical woman, and she has a staff of medical women to assist her. Medical women also hold high administrative posts under the Home Office, Board of Education, Board of Control, etc.

The Public Health Service.—This service provides numerous openings for medical women. It has many departments, and its rapid growth in recent years has provided much interesting work in preventive medicine. Senior departmental posts are frequently held by medical women, and several occupy posts as medical officers of health. Notable amongst these is a woman who is M.O.H. of a large London borough. For maternity and child welfare work women have been found to be peculiarly suited; but, by a curious economic limitation, married women, who would appear to be the most suitable of all, are, by many public authorities, excluded from service. This exclusion not only prevents married women from taking part in this work, but also prevents many of the best women from specializing in this branch of medicine, as it is obviously uneconomic to specialize in a branch of public service from which one may be excluded in a few years.

Medical Inspection, etc.—Under the Board of Education there are women serving as medical advisers and school medical inspectors. The London County Council and other important councils in the country have medical women on their permanent medical staffs, in both the senior and junior grades. The London County Council has two of its senior medical women appointed to serve as district medical inspectors. In addition, they have a large number of women medical inspectors of school children, and also women are serving as experts in the departments dealing with mental deficiency, tuberculosis, and venereal disease. Some medical women also serve as examiners of the candidates entering the public services, as, for example, the civil service. The services of medical women are extensively enlisted by public authorities in dealing with employees of their own sex. In several instances women serve as assistant medical officers to prisons. The services of medical women are also enlisted as lecturers and examiners on first aid, home nursing, health, and infant care. The new Local Government Act has meant the taking over of a large number of hospitals by the local authorities, and many good openings for medical women as residents are occurring.

PAY AND STATUS

It is interesting to note that medical women, backed by the powerful assistance of the British Medical Association, have been on the whole successful in resisting the attempt to accept a lower salary for the same work as their men colleagues, thereby not only greatly benefiting themselves, but also maintaining the standard for the whole profession. They realize that ever since the admission of women to the medical profession exactly the same sacrifices for principle have been made by their predecessors as are now demanded from them. With the inauguration of the School Medical Service in 1908, and later when maternity and child welfare posts were created, persistent efforts were made by local authorities to pay their assistant medical officers below the minimum arranged by the representatives of the public authorities and the British Medical Association, and to secure women at a lower rate than men. With rare exceptions these efforts were a failure. Women realize as clearly as men that lowered pay invariably implies a lowered status and prestige, and that the woman who stamps herself as belonging to an inferior grade of doctor cannot complain if she is taken at her own valuation, and that a minimum always tends to become a maximum. Attempts to evade the scale and split the ranks of the profession by offering a post to a man at the agreed rate and a similar post to a woman slightly below that rate are particularly to be deprecated. Where the rule of equal pay for equal work is violated there is no limit to the extent to which women may be exploited.

OPENINGS ABROAD

Colonial Office.—To those to whom oversea service appeals it offers the possibility of useful, interesting, and adequately paid work. At present there are posts for women in Malaya, and East and West Africa. The work is almost entirely hospital and maternity and child welfare work; there have been one or two specialist appointments, such as bacteriologists, and more may follow. Women have, so far, only been appointed to the lower-grade posts, but their pay is the same as that of the men in similar grades. When placed on the permanent staff they are eligible for pension.

Egypt.—Appointments in the Kitchener Memorial Hospital, Cairo, which forms part of the Clinical Faculty of the University of Cairo, are held by women. Appointments in certain dispensaries are open to medical women. There are also posts held under the education authority, chiefly school medical inspection.

India.—See note on the Women's Medical Service for India below.

Mission Field.—Missionary societies offer employment to medical women, chiefly in India, China, and the Near East.

PUBLIC ACTIVITIES

Medical women are frequently appointed to serve on Royal Commissions and Government Committees dealing with medical subjects, and are also requested by them to give evidence of an expert medical nature.

Medical women have always shown considerable interest in medico-political affairs, and take an active part in the work of the British Medical Association, and with the various other societies dealing with medicine as it affects the community in general. With this end in view they also have a Medical Women's Federation, which enables them to voice a collective expression of opinion. This might otherwise be difficult to ascertain, as women are so widely scattered, both as regards their geographical distribution and their varied activities. This collective opinion of medical women has been found of great assistance by the British Medical Association and other allied societies with which it works in cordial co-operation and by whom it is frequently approached, both for information and also as a convenient means of approaching medical women as a whole.

It may be added, with regard to contributions to medical literature, that this is a branch of work in which women are more and more taking their share, and scientific and other works are frequently published by them.

WOMEN'S MEDICAL SERVICE FOR INDIA

Among careers open to medical women abroad the Women's Medical Service for India deserves honourable mention. This Service is open to fully qualified medical women of British or Indian nationality, and with the present amount of Government subsidy the number of medical officers is limited to 44.

Medical women proceeding to India to join the Women's Medical Service receive a sufficient sum for a first-class passage to India. On landing they are posted to one of the larger women's hospitals to gain Indian experience and to learn the language. For a further period they are appointed to act temporarily for medical women on furlough. They are then definitely appointed to the charge of hospitals. Private practice is allowed provided it does not interfere with official duties. The only exception is in administrative or educational posts when an allowance in lieu of practice is given. The amount obtained from practice varies according to the station but in most cases it forms a fair addition to the salary, varying from £150 to £1,000 a year.

Excellent opportunities for surgery—especially gynæcological—are found in the Women's Medical Service. To those who are not keen surgeons opportunities are likely to open in the future in connexion with maternity and child welfare. Rates of pay are as follows:

Years of Service	Overseas Allowance per Mensem	Salary per Mensem	English Equivalent* per Annum
1 to 3	Rs. 100	Rs. 450	£440
4 to 6	Rs. 100	Rs. 500	£480
7 to 9	Rs. 100	Rs. 550	£550
10 to 12	Rs. 100	Rs. 600	£560
13 to 15	Rs. 150	Rs. 650	£600
16 to 18	Rs. 150	Rs. 700	£640
19 to 21	Rs. 150	Rs. 750	£680
22 to 24	Rs. 150	Rs. 800	£720
Over 24	Rs. 150	Rs. 850	£760

* At rupee value 1s. 4d.

Furnished quarters are provided, representing an additional Rs. 150 per mensem.

The cost of living in India is much higher than formerly, but it should be possible for a medical woman (with house provided) to meet actual household expenses for about Rs. 300 per mensem, leaving the remainder of her salary for dress and personal expenses. To this must be added the necessary saving to meet additional expenses for furlough and leave spent in the hills.

Leave on average pay is earned at the rate of two-elevenths of the period spent on duty.

Study leave is granted to the extent of twelve months in the total service, and will not be granted more than twice in the course of an officer's service. During study leave an officer draws half average pay, with a study allowance at the rate of 12s. a day during the course of study. Officers of European domicile are entitled to four free return first-class passages from a port in India to a port outside India in their whole service. The first passage is not granted until after the expiry of four years' approved service, and thereafter passages may be granted at intervals of not less than four years. There is a Provident Fund to which members of the Service contribute 10 per cent. of their pay. The Service contributes another 10 per cent. which accumulates at interest and is repaid on retirement.

Admission to the Service is made by selection in India and England, preference being given to those with Indian experience. Vacancies are few. Candidates in the United Kingdom should apply to the honorary secretary, United Kingdom Branch of the Countess of Dufferin's Fund, c/o Major-General Sir Leonard Rogers, India Office, Whitehall, London. Candidates in India should apply to the Chief Medical Officer, Women's Medical Service, Countess of Dufferin's Fund, Simla and Delhi.

Post-Graduate Study

Post-graduate students may be divided into general practitioners desirous of refresher courses, usually covering a wide field within a relatively short period of time to bring their knowledge up to date; those who wish for instruction in special subjects with a view to obtaining one of the special diplomas or of preparing for some higher examination, perhaps with a view to promotion in one or other of the medical services; or if already general practitioners of adding some form of specialism to their work; and visitors, whether from the overseas Empire or from foreign countries, who wish to pursue intensive studies in special subjects or to familiarize themselves with the methods of practice in Great Britain.

It is clear that London, with the large and varied amount of material available, and with its wealth of professional skill and teaching power, offers ample opportunity for the supply of all these needs if suitable concentration and organization of effort were brought about and established. So far, however, no definite post-graduate school of the character indicated exists. There is no recognized hostel or meeting place to which the student can resort for social purposes, such teaching centres as exist are widely scattered, and their efforts are limited in scope and largely unsystematized. Two hospitals—the West London Hospital at Hammersmith, and the Prince of Wales's General Hospital at Tottenham—have for many years had post-graduate colleges attached to them. Their efforts are valuable and praiseworthy, but they can cater only for a limited number of general practitioners, and these largely drawn from those whose practices are within a relatively short distance of the schools. The general practitioner may also perhaps find a refresher course at the hospital at which he was trained held during a vacation, and similar short courses are organized from time to time at one or other of the London Hospitals under the auspices of the Panel Committee for the County of London. The Fellowship of Medicine too arranges definite courses of study at individual hospitals and at its office—generously placed at its disposal by the Royal Society of Medicine at 1, Wimpole Street, W.1—a list of hospitals, special and general, to which medical graduates may resort, with or without fee, is kept, and the names of the teachers at each hospital are available. Occasional courses

of a more special character may thus be discovered, and there are a few others which are regularly held once or twice a year, such as that in mental deficiency which is organized by the Central Association for Mental Welfare in conjunction with the University of London, and those dealing with various aspects of medical psychology given at the Tavistock Square Clinic.

Over and above such isolated or occasional teaching, it is possible to obtain under one roof instruction in all branches of preventive and of tropical medicine at the London School of Hygiene and Tropical Medicine, at the corner of Keppel Street and Gower Street. This institution has now been open for two years and has already established itself as a most valuable school of the University of London, and probably the most important of its kind. Its work has been arranged in the following divisions: public health, including a section devoted to the physiology of hygiene; epidemiology and vital statistics; bacteriology and immunology; biochemistry, including a department for chemistry as applied to hygiene; medical zoology embracing the departments of protozoology, helminthology, and entomology; and tropical medicine and hygiene, for the clinical work in connexion with which facilities are afforded by the Hospital for Tropical Diseases in Gordon Street close by. At the Seamen's Hospital, too, in co-operation with the London School of Hygiene and Tropical Medicine, special post-graduate courses for ship surgeons are now to be held systematically, as the result of action taken by the British Medical Association during the past year.

The shortcomings of London as a post-graduate medical centre have been recognized for a long time, and it is gratifying to know that practical steps are now being taken to remedy the several disabilities that have been mentioned, and to establish in the very near future under the auspices of the London County Council and the University of London, and with governmental financial aid, a real post-graduate hospital and medical college which will be worthy of the metropolis of the Empire. As long ago as 1921 a committee on post-graduate medical education was set up under the chairmanship of the Earl of Athlone. The establishment of "a school attached to a hospital centrally situated in London devoted solely to post-graduate medical education as a school of the University" was the chief recommendation that resulted. In 1925 a second committee was appointed "to draw up a practical scheme of post graduate medical education centred in London." The scheme finally suggested was to use one of the Poor Law hospitals transferred to the London County Council under the Local Government Act, 1929, as a British Post-Graduate Hospital, and to establish a fully equipped medical school in connexion therewith. The hospital chosen for the purpose is the Hammersmith Hospital at Shepherd's Bush, which is a modern institution with, at present, 400 beds, on a site of sufficient acreage to allow of extension and of the creation of the necessary college buildings. A third committee was appointed just over a year ago. This was known as the Provisional Organization Committee, with Lord Chelmsford as chairman, and had as its reference to report to the Minister of Health upon "(1) the action requisite to lead up to the planning and construction of the medical school, and (2) the form of government appropriate to the hospital and medical school with special reference to the position of the London County Council as the local authority responsible for the hospital, and to the position of the University of London in relation to the medical school." The committee reported at the end of March last on the main questions involved in the second part of its reference, and this has already resulted in the approval by the King in Council of a Royal Charter constituting the Governing Body of the school and defining the functions of the governors. The Governing Body will consist of representatives of various government departments, of the London County Council, of the University of London, and of the Royal Colleges of Physicians and Surgeons, the Society of Apothecaries, the Royal Society of Medicine, and the British Medical Association. It will at once take in hand the actual planning of the building and settle in detail all those arrangements which will be necessary in accordance with the main proposals of the Provisional Organization Committee. It is impossible to say at present exactly when the hospital and school will be opened for teaching purposes, but there is some hope that this may take place before the end of next year. A great step forward has thus been taken. London will, before long, become, as it should be, a world centre of post-graduate medical training.

In the provinces the Universities of Oxford, Cambridge, Birmingham, Bristol, Liverpool, Manchester, and Sheffield have organized courses of post-graduate work and instruction. Liverpool University is now establishing a regular course for ship surgeons on similar lines to that already mentioned in London. Edinburgh receives graduates from many schools in the Dominions as well as in this country. In Glasgow and in Aberdeen courses are available, and, in relation with the University of St. Andrews, courses are given by the James Mackenzie Institute for Clinical Research. At many of these centres the teaching is provided by whole-time intensive courses, by part-time courses, and by means of clinical assistantships. The Joint Tuberculosis Council has provided nomadic courses in its own special subject.

Short particulars about the facilities for post-graduation study at present obtainable in Great Britain and Ireland are given in Section IV of the *Handbook for Recently Qualified Practitioners*, published by the British Medical Association (price 3s. 6d.).

Fellowship of Medicine and Post-Graduate Medical Association

The Fellowship of Medicine has arranged regular courses in general medicine and surgery, including special departments, each lasting two weeks; the fee for each course is 3 to 5 guineas. Courses in diseases of the chest, children, ante-natal, heart, nervous system, throat, nose, and ear; dermatology; gynaecology; proctology; orthopaedics; fractures; psychological medicine; tropical medicine; urology; and venereal diseases are given from time to time at the special hospitals in association with the Fellowship of Medicine. Evening courses for the M.R.C.P. and F.R.C.S. (Final) are arranged also. The Fellowship "General Course" Programme contains a diary of the arrangements available for post-graduates in various general and special hospitals in London. The list for the immediate future special courses includes one week's course in chest diseases, from September 7th to 12th; a two weeks' course in general medicine and surgery, from September 14th to 26th, at the Westminster Hospital; in diseases of infants, at the Infants Hospital, from September 14th to 26th; ophthalmology at the Central London Ophthalmic Hospital, from September 14th to October 10th; general medicine and surgery at the Metropolitan Hospital, from September 28th to October 10th; and in psychological medicine, at the Bethlem Royal Hospital, from September 8th to October 3rd. The office of the Fellowship is, by kind permission of the Royal Society of Medicine, at No. 1, Wimpole Street, W.1 (telephone, Mayfair 2236). The secretary is in attendance daily from 10 a.m. to 5 p.m., excepting Saturday. The annual subscription for membership of the Fellowship of Medicine and Post-Graduate Medical Association has been fixed at a minimum of 10s.

which includes the subscription to the *Post-Graduate Medical Journal*.

The Fellowship arranges, during the autumn and winter sessions, a series of lectures. Special clinical demonstrations in medicine and in surgery are arranged also weekly from October onwards. Syllabuses will be sent regularly on application.

National Post-Graduate School of Radiotherapy

The working scheme announced in our issue of June 28th, 1930 (p. 1185), between the London Radium Institute in Riding-house Street and the Mount Vernon Hospital at Northwood, for the establishment under joint control of a National Post-Graduate School of Radiotherapy, is in full operation. The next course of study in radiotherapy will commence on Monday, October 5th, 1931. Applications for copies of the syllabus and other information may be addressed to the Dean (Sir Cuthbert Wallace, K.C.M.G., F.R.C.S.) at the National Post-Graduate School of Radiotherapy (the Mount Vernon Hospital and Radium Institute), Riding-house Street, London, W.1.

West London Post-Graduate College

The work of this institution is carried on at the West London Hospital, the first in London to devote its clinical material solely to the instruction of qualified medical men. The college started in 1895; it is provided with lecture, reading, writing, and class rooms, and accommodation of all sorts for the convenience of post-graduate students. The work of the college is eminently suitable for men in general practice and officers in the services who wish to revive their general clinical knowledge.

As for ward work, the students accompany the senior staff on their visits to the wards daily. The out-patient department is large, and affords ample facilities for post-graduates to see and examine patients. There are the usual special departments. Post-graduates are appointed to act as clinical assistants for three or six months, no charge being made. Special practical classes are held in medicine, general practical surgery, gastro-intestinal surgery, medical and surgical diseases of children, analysis of blood and urine, cystoscopy, venereal diseases, tropical diseases, retinoscopy, ophthalmic operative surgery, and, when material is available, in operative surgery. The size of the classes is limited. A special clinic for the treatment of venereal diseases (male and female) is held all day. Graduates are admitted to the work of the clinic free, and certificates of satisfactory attendance and work are given.

Operations take place at 2 p.m. daily, the surgeons often availing themselves of the assistance of the graduates, and in any case making arrangements so that they can readily see what is going on. The anaesthetists give instruction in the administration of anaesthetics, including spinal analgesia, on the operating days, students being allowed to administer them under supervision, while special classes are held in each session. The pathological laboratory is in charge of a pathologist, who attends every day.

Demonstrations are given in the morning by the assistant physicians and surgeons, and by the medical and surgical registrars.

The certificates of the school are recognized by the Admiralty, the War Office, the Colonial Office, the India Office, and the University of London (for higher degrees). The general course is recognized as being suitable for practitioners taking a course of study under the Ministry of Health "grant-aided scheme for post-graduate study by insurance practitioners in rural areas."

A prospectus can be obtained an application to the Dean.

Fees.—Hospital practice, including all ordinary demonstrations and lectures, £1 1s. for one week, £4 4s. for one month, £7 7s. for two months, £9 9s. for three months, £15 15s. for six months, £23 12s. 6d. for one year, and £45 for a life ticket. Instruction in the administration of anaesthetics is given at the rate of £3 3s. a month.

North-East London Post-Graduate College

The headquarters of this post-graduate school are situated at the Prince of Wales's General Hospital, Tottenham, N.15, in the midst of this densely populated North London district. It contains 200 beds, and is within a few minutes' walk of South Tottenham Station on the London Midland and Scottish Railway, and Seven Sisters and Tottenham Hale Stations on the London and North-Eastern Railway. It is readily accessible by electric tram from Finsbury Park and Hackney, and from Dalston, Edmonton, and other parts of North London. The North Middlesex Hospital, Edmonton, N.18, with upwards of 1,000 beds, has, under a recent arrangement, taken part in the clinical teaching.

The college is in association with the Fellowship of Medicine and Post-Graduate Medical Association, and is recognized by the Admiralty and India Office for the purpose of study leave, and by the University of London as a place for advanced study for the M.D. and M.S. degrees, the course of practical teaching of bacteriology is approved by the University of Cambridge for its Diploma in Public Health, and there are ample arrangements for the convenience of men who are thus working, or who, being in active practice, are desirous of getting themselves into touch with modern methods. The hospital as a whole affords excellent facilities for qualified medical practitioners who wish to take part for a time in active general hospital work, or to obtain special instruction in the several branches of medicine and surgery, since it is open to them to study diseases of the eye, ear, throat, nose, skin, fevers, children's diseases, psychological medicine, dental surgery, radiography, the application of electricity in disease, and the administration of anaesthetics. Throughout the sessions, into which the year's work is divided, clinics, lectures, and demonstrations are given by members of the teaching staff. Operations are performed every afternoon of the week except Saturday. Special vacation or intensive courses are held at intervals throughout the year, each lasting two weeks, clinical instruction being arranged for each hour of each day. The winter session will be opened about the middle of September as regards clinical teaching.

Fees.—For the hospital practice in general medicine or surgery the fee is 5 guineas for three months or 2 guineas for one month. Provided there is accommodation in the special departments the fees are: eye department 3 guineas; gynæcological department 5 guineas; ear, nose, and throat department 5 guineas for three months. All departments—the fee is 3 guineas for one month, 6 guineas for three months, 10 guineas for a year, and 15 guineas for a perpetual ticket.

Additional information can be obtained from the Dean of the Post-Graduate College, at the Prince of Wales's Hospital.

Manchester Post-Graduate Courses

The Faculty of Medicine of the University of Manchester has arranged courses in preparation for the diplomas in psychological medicine, in public health, bacteriology, pathology, and veterinary State medicine. There are classes also for certificates in factory and school hygiene and in venereal diseases. The Faculty of Medicine has also instituted courses to meet the requirements of graduates desiring to refresh their knowledge or to pursue further their studies in various special branches. The arrangements are in the hands of a committee consisting of certain members of the faculty, of representatives of hospitals, and of the medical officer of health for Manchester. Full particulars can be obtained from the Dean of the Medical School, the University, Manchester. Part-time courses will be given during 1931-32 in diseases of the eye, diseases of the skin, practical instruction in local anaesthesia and minor operative surgery, and in practical clinical medicine. A limited number of clinical assistantships at the discretion of the hospitals are offered in the medical, surgical, and special departments of the Manchester Royal Infirmary, the Ancoats Hospital, and certain special hospitals for one, two, or three months, or longer. A clinical assistantship at the Radium Institute for three months is offered. Clinical teaching for post-graduates is given each Thursday during university terms by the honorary staff at Ancoats Hospital, no fee charged.

Post-Graduate Courses at Bristol

The University of Bristol provides courses of post-graduate study for practitioners. Details of set courses at the Royal Infirmary and General Hospital are announced locally. In addition, practitioners may become clinical assistants in medicine, surgery, or special subjects for periods of a month or more.

Daily Post-Graduate Study.—For those who are able to devote several hours each day to hospital practice the university offers special facilities for post-graduate work. Qualified medical practitioners may be appointed as clinical assistants for a period of one or more months. They may act as assistants, if times permit, in more than one department and in any of the hospitals during their period of study. They will be entitled to the use of the clinical laboratories and medical library, and have the right to attend in all departments, including operations, post-graduate and ordinary clinical demonstrations, and post-mortem examinations.

All inquiries and applications for admission should be addressed to the Director of Post-Graduate Studies (Clinical Section), Pathological Department, University of Bristol, who can be seen on any day by appointment at the Pathological Department.

Post-Graduate Courses at Newcastle

For the year 1931–32 the following post-graduate courses have been arranged by the College of Medicine, Newcastle-on-Tyne (University of Durham):

1. General courses in clinical medicine, surgery, and pathology at the Royal Victoria Infirmary, meeting once weekly for ten weeks. One course will be held from October to December, and one from April to June.
2. Special courses of clinical instruction meeting once weekly for ten weeks in the following subjects: gynaecology, diseases of the eye, diseases of the throat, nose, and ear, diseases of the skin, venereal diseases, neurology. Special courses in midwifery will be held at the Princess Mary Maternity Hospital.
3. An intensive course of fourteen days' duration in the summer vacation, 1932.
4. In addition to the regular post-graduate courses, practitioners may attend the ordinary medical and surgical practice of the Royal Victoria Infirmary, and also at the Princess Mary Maternity Hospital, for specified periods.

Edinburgh Post-Graduate Courses

In connexion with the University and Royal Colleges post-graduate courses are arranged every year, from about the middle of July to about the middle of September, comprising: (*a*) a course in obstetrics, gynaecology, and diseases of children, held from July 13th to August 8th; (*b*) a general practitioner course; (*c*) a general surgical course. Courses (*b*) and (*c*) extend for four weeks from August 10th to September 5th. Similar courses are held each year.

The course in obstetrics, gynaecology, and diseases of children comprises instruction in clinical midwifery and clinical gynaecology, obstetrics and gynaecological pathology, diseases of children, child welfare, and ante-natal clinics, etc.

The general practitioners' course includes lecture-demonstrations, and, where possible, practical instruction on medical anatomy, medical sideroom work, examination of the blood, *x*-ray and electrical therapy, morbid anatomy, and post-mortem examination; clinical instruction in medicine, surgery, gynaecology, diseases of children, diseases of the skin, and infectious diseases; and special instruction in the diseases and methods of examination of the nervous, circulatory, respiratory, alimentary, and renal systems, and in diseases of the ductless glands. The general surgical course includes lecture-demonstrations on surgical anatomy, surgical pathology, and surgical *x*-ray diagnosis; clinical instruction in surgery at the Royal Infirmary and Royal Hospital for Sick Children; clinical instruction in venereal diseases, surgical out-patients, surgical and gynaecological operations, and special instruction in abdominal and genito-urinary and other branches of surgery.

A series of special lectures and clinical discussions, open to all graduates, is arranged on subjects of general medical and surgical interest. Among the special courses also arranged at various times of the year are: examination of the blood, vaccine therapy, diseases of the ear, nose, and throat, pathology of the nervous system, ophthalmoscopy, venereal diseases, *x*-ray physics and electrotechnics, tuberculosis, ultra-violet radiation and their uses, the interpretation and significance of modern diagnostic methods, surgical pathology, clinical surgery, and clinical medicine.

Particulars regarding the courses, dates of commencing, fees, etc., may be had on application to the Honorary Secretary, Post-Graduate Courses in Medicine, University New Buildings, Edinburgh.

Post-Graduate Medical Teaching in Glasgow

Organized post-graduate medical teaching is available in Glasgow under the auspices of the Post-Graduate Medical Association. This association represents practically all the teaching institutions in Glasgow and the various teachers giving post-graduate instruction, and its business is managed by a board elected periodically by them. The chairman of the board is Professor Robert Muir. During the winter months special courses in various subjects are conducted, and from November till May there is a series of weekly demonstrations specially designed for local practitioners. Clinical courses are carried out during the summer months, and arrangements have also been made whereby a limited number of graduates may become attached to wards or out-patient departments nominally as clinical assistants for definite periods throughout the year. As such they work under the direct supervision of the physician or surgeon in charge, and carry out such detailed investigations as directed.

A general medical and surgical course is held each year during the last two weeks of August and the first two weeks of September, which is arranged to include most of the subjects of interest to the general practitioner. This year the course is being conducted from August 17th to September 11th. The forenoons are occupied with general medicine and surgical diagnosis and minor surgery, in the Royal Infirmary and in the Victoria Infirmary. In the afternoons special subjects are dealt with in the special hospitals and in the special departments of the general hospitals, two subjects being considered most afternoons.

Further information may be had on application to Dr. James Carslaw, Secretary, Post-Graduate Medical Association, 9, Woodside Terrace, Glasgow, C.3.

Australian and New Zealand Medical Association

The Australian and New Zealand Medical Association gives information and advice to medical visitors from the Commonwealth and Dominions with regard especially to attendance at special clinics, post-graduate work, and facilities for preparing for examinations such as the M.R.C.P., F.R.C.S., etc., and also as to house appointments and clinical assistantships in London and the provinces. Information will also be given about lodgings, sports, and social opportunities. Two dinners are held annually. All medical graduates or undergraduates born in Australia or New Zealand and resident in or visiting England are eligible to become members. The fee is one payment of 5s. Further information can be obtained from the joint honorary secretaries, Mr. E. T. C. Milligan, F.R.C.S., 106, Harley Street, W., and Mr. Philip J. Jory, F.R.C.S., 26, Queen Anne Street, W.

Tropical Medicine

There are large and important Schools of Tropical Medicine in London and Liverpool, and the Colonial Office expects all nominees for the Colonial Medical Service to pass through one or other of the two schools mentioned before their appointments are confirmed, and commercial firms engaged in tropical enterprise commonly demand from medical applicants for employment corresponding evidence of special knowledge. Information with regard to these schools and diplomas and degrees is given in the paragraphs printed below. The University of London alone

gives a degree (M.D.) in Tropical Medicine, and this, being an "internal degree," can only be taken by students who are medical graduates of that university. Diplomas in Tropical Medicine or Hygiene are granted by the universities of Edinburgh and Liverpool, and by the Conjoint Board of the Royal College of Physicians of London and the Royal College of Surgeons of England.

Diplomas and Degrees

LONDON UNIVERSITY.—Tropical medicine is one of the six branches in which the M.D. degree may be obtained. The regulations relating to the curriculum and examination correspond to those applying to the other branches.

THE EXAMINING BOARD IN ENGLAND.—This body grants a diploma in tropical medicine and hygiene to candidates after an examination held in the months of January, April, and July. Candidates must present evidence of having attended, subsequently to obtaining a registrable qualification in medicine, surgery, and midwifery, (1) practical instruction in pathology, protozoology, helminthology, entomology, bacteriology in an institution recognized for this purpose, together with the clinical practice of a hospital recognized for the study of tropical diseases during not less than three months; and (2) tropical hygiene and sanitation in an institution recognized for this purpose during a further period of not less than two months. These conditions may be modified in the case of candidates who have had practical experience in tropical countries. The fee for admission to the examination is £9 9s. The Board also grants diplomas in public health, in psychological medicine, in ophthalmic medicine and surgery, in laryngology and otology, and in gynaecology and obstetrics. Graduates in medicine and surgery of Indian, Colonial, and foreign universities recognized by the Examining Board of England, whose degrees are not registrable in this country, may enter for the examination for the Diploma in Tropical Medicine and Hygiene on fulfilling the above conditions in regard to study. Particulars and conditions of admission to these examinations, fees, etc., may be obtained from the Secretary of the Examining Board, Examination Hall, Queen Square, London, W.C.1.

UNIVERSITY OF LIVERPOOL.—A diploma in tropical medicine is given by this university to students who have attended the courses provided by the Liverpool School of Tropical Medicine and have passed the examination held twice yearly by the university examiners. The subjects of examination are: (*a*) parasitology and tropical pathology; (*b*) entomology; (*c*) tropical medicine, including etiology, symptoms, diagnosis, and treatment of tropical diseases. Fee for the course, £21. A diploma in tropical hygiene (D.T.H.), open to the holders of the D.T.M., has recently been established. The subjects of examination are tropical hygiene (including sanitary engineering, vital statistics and epidemiology, and applied parasitology and entomology); practical sanitation, bacteriology, chemistry (including meteorology and climatology). Fee for the course, £12 16s. Further information can be obtained from the Dean of the Faculty of Medicine, University of Liverpool.

UNIVERSITY OF EDINBURGH.—Candidates for the diploma in tropical medicine and hygiene granted by the University of Edinburgh must be graduates in medicine and surgery of that university, or held corresponding registrable degrees or qualifications of some other licensing body. The course of instruction, which commences in October, extends over two terms. The examinations (Part I and Part II) are written, oral, and practical, and are held at the end of the courses. Candidates, on the first occasion of presenting themselves for examination in either part, are required to appear for all the subjects of that part. Those who fail to pass the entire examination in either part within a period of twelve months after first appearance are required to reappear for all the subjects. The university is included in the list of institutions whose courses of instruction in tropical medicine may be taken by officers on appointment to the Colonial Medical Services or during study leave. Full particulars can be obtained from the Dean of the Faculty of Medicine, Edinburgh.

SCHOOLS

London School of Hygiene and Tropical Medicine (University of London)

The courses of study in all branches of the work of the School will commence in the autumn in the premises in Keppel Street (Gower Street), the gift of the Rockefeller Foundation, which has excellent laboratories and research rooms, a fine lecture theatre and class rooms, library, and museum.

The course of instruction in tropical medicine and hygiene has been divided into two parts: Section A, a three-months' course of clinical and laboratory instruction, and Section B, a two-months' course in tropical hygiene. Each section has been so designed that it can be taken independently of the other, and the examinations by the Conjoint Board will follow closely upon the end of the corresponding course of study. This revised course is recognized by the University of London as a course for associate students.

The dates of the courses for the session 1931–32 are as follows:

Section A (Clinical and Laboratory Instruction).—First course, September 29th to December 18th, 1931. Second course, January 4th to March 24th, 1932. Third course, April 11th to June 30th, 1932.

Section B (Tropical Hygiene).—First course, January 18th to March 18th, 1932. Second course, April 18th to June 17th, 1932.

The course of instruction under Section A includes clinical tropical medicine, applied pathology, medical zoology, and elementary bacteriology. Section B comprises instruction in tropical hygiene, including, in relation to hygiene, bacteriology, medical zoology, anthropology, and vital and medical statistics.

There has been established within the School a new division of clinical tropical medicine. The instruction in the new division will be given by the medical staff of the Hospital for Tropical Diseases and by visiting lecturers. In this way the splendid resources of the hospitals of the Seamen's Hospital Society at Endsleigh Gardens, at the Albert Docks, and elsewhere, become available for the clinical instruction of the students at the School.

The course of study for the diploma in public health will commence on September 28th, and will extend over a period of nine months' whole-time study. It is arranged in compliance with the requirements of the General Medical Council, and students taking the course will be able, should they so desire, to proceed to the academic diploma in public health of London University. The curriculum has been planned on very practical lines, and includes, in addition to work with medical officers of health in two selected areas, a large number of visits to places of public health interest. A series of 5 o'clock lectures is given by eminent authorities on special subjects, and these lectures will be open to members of the medical profession as well as to students of the school. The London County Council, the City of London, and various other bodies have placed their resources at the disposal of the School for teaching purposes.

The special course of study for the diploma in bacteriology covers a period of one academic year beginning in October, and special three-monthly courses will be given in epidemiology and vital statistics.

An interesting recent development is the establishment in the School of a university chair of medical industrial psychology.

The University of Edinburgh

A course of instruction for the diploma comprising a primary and a secondary course is given during the autumn and spring terms (October to March), and includes tropical hygiene, bacteriology, entomology, and parasitology, diseases of tropical climates (systematic and clinical), tuberculosis, and venereal diseases. The university is included in the list of institutions whose courses of instruction in tropical medicine may be taken by officers on appointment to the Colonial Medical Services or during study leave. Full particulars can be obtained from the Dean of the Faculty of Medicine.

Liverpool School of Tropical Medicine

This school is affiliated with the University of Liverpool The university now grants diplomas in tropical medicine (D T M) and in tropical hygiene (D T H)

Two full courses of instruction, each lasting about eleven weeks, are given every year for the D T M , commencing respectively October 1st (autumn term) and January 6th (Lent term) , and two courses for the D T H , beginning on January 13th and April 21st (summer term) The D T H can only be taken by those who have obtained the D T M Students who do not desire to take the diploma examinations held by the university at the end of each term are given a certificate if attendance has been satisfactory

Fees —(1) For the D T M course, 20 guineas for the D T H course, 10 guineas (2) For the diploma examinations 5 guineas An extra charge of one guinea is made for the use of a microscope if required

The laboratories of the school adjoin the university and the tropical ward of the Royal Infirmary The dimensions of the building are 162 feet in maximum length by 84 feet in width In addition to the basement, in which are accommodated the photographic department and large storage rooms, there are four floors The ground floor has (1) lecture theatre, with accommodation for about seventy students , (2) library , (3) a spacious museum with preparation room adjoining The first floor has twelve rooms, in which are housed the departments of tropical medicine and entomology The second floor has the main class laboratory, 69 feet by 58 feet, excellently lighted , and three other rooms, devoted to the department of parasitology The third floor has a large research laboratory and two research rooms On the roof is an insectorium, a mosquito proof house, and other accommodation

Since its foundation the school has dispatched to the Tropics thirty-two scientific expeditions, many of the workers having been taken from among its students The work done by the staff has been published in twenty-one special memoirs—in the *Annals of Tropical Medicine and Parasitology*, issued by the school, and in numerous articles in the scientific press

The school also has a laboratory in the Tropics the Sir Alfred Lewis Jones Tropical Laboratory in Sierra Leone, which was opened on January 10th, 1922, and is staffed by the school Further information may be obtained from the honorary Dean, School of Tropical Medicine, Pembroke Place, Liverpool

Psychological Medicine

It cannot be impressed too strongly upon the medical student that a knowledge of mental disorder is just as essential as a knowledge of the other forms of disease which he will be called upon to treat in the routine of general practice It must be understood that by the term " mental disorder " is not only meant those severe forms which are to be found in mental hospitals, but the term also includes mental defectives of all grades , nervous, difficult, and backward children , the mild and often unrecognized psychoses , and also the various types of psychoneurosis Such disorders provide the general practitioner with a large proportion of his most difficult cases, and he will find a good knowledge of mental disorder invaluable in his work Apart from general practice, the student who proposes to take up a career in the prison service, or, still more important, the school medical service, will find a knowledge of psychological medicine an almost essential part of his equipment

INSTRUCTION

Though at the present time the instruction given to the student is far from adequate to supply the knowledge of mental disorder requisite for the needs of the general practitioner, the facilities for the study of psychological medicine in the general hospitals are now much greater than in former years Thus many of the teaching hospitals have out patient departments for the treatment of mental cases, and in some of these hospitals special lectures are given in psychopathology These facilities need not be utilized by the student, however, and the compulsory part of the curriculum is generally confined to formal lectures and a few attendances at some mental hospital Here the student is apt to see mainly the advanced states of mental disease, and is likely to gain the impression that mental disorder is necessarily related to segregation and custody We would therefore impress upon him the importance of attending the out patient department for mental disorders, where he will be able to observe the mild and early cases such as he will hereafter meet with in general practice

At the Middlesex Hospital a small number of mental cases are treated in the hospital as in patients This is an important move from the teaching point of view, because the student will gain true insight into the relation between mental disorder and medicine as a whole and he will realize that it is a form of illness to be studied with other diseases and to be treated along similar lines

In London, post graduate courses of instruction of a comprehensive kind are given at the Maudsley Hospital and at Bethlem Hospital , and at the National Hospital Queen Square, courses are arranged to meet the requirements for the diploma in psychological medicine in regard to nervous diseases Courses in mental deficiency are arranged by the University of London There are also post-graduate courses at the various universities which grant diplomas of psychological medicine or of psychiatry

DIPLOMAS

Those who are taking up psychiatry as a career will find it desirable to obtain a diploma in psychological medicine Such a diploma is not at present compulsory for a permanent position on the staff of all mental hospitals, but it will probably become so in course of time just as it is now essential to obtain the D P H if a career in public health is contemplated Psychiatry is one of the branches of medicine which candidates for the M D degree of the Universities of London and Edinburgh can take up, and, in addition, diplomas in psychological medicine (D P M), to which reference has been made can be obtained from the Universities of London Edinburgh, Durham, Leeds, Manchester, Dublin, and the National University of Ireland, and from the Conjoint Board in England The requirements for a diploma differ to some extent in the various universities and colleges

University of London (D P M)

The diploma awarded by the University of London certifies that the candidate has passed the examination in psychological medicine with special knowledge of one or other of the two branches either psychiatry or mental deficiency special provision being made for this in Part B of the examination The examination is held twice in each year Part A in May and October, and Part B in April and November Part A consists of anatomy, histology, and physiology of the nervous system (one paper and a practical examination) and psychology (one paper and an oral examination) Part B comprises neurology (paper, and clinical and oral examination) and psychological medicine (two papers and clinical and oral examinations) Paper I tests the candidate's general knowledge of both mental diseases and mental deficiency and Paper II is a special one consisting of two alternative sections one relating to mental diseases and the other to mental deficiency A copy of the Regulations and of the Syllabus of Study will be sent on application to John Lea M A University Extension Registrar, University of London, South Kensington S W 7

Conjoint Board of England (D P M , R C P and S

Both parts of the examination are held in June and December The examination comprises the following subjects with special regard to their relationship to psychological and

medicine —Part I (*a*) anatomy and physiology of the nervous system (*b*) psychology Part II (*a*) neurology (including clinical and pathological neurology) (*b*) psychological medicine including its legal relationships The examination will be written and oral in Part I and written oral and clinical in Part II No special certificates of study are required for Part I but before entering for Part II candidates must produce certificates of (*a*) having attended clinical instruction for at least two months at a recognized hospital for nervous diseases or in the department for nervous diseases of a recognized general hospital (*b*) having held a resident or whole time appointment at an institution for mental diseases where clinical instruction is given recognized for the purpose for a period of six months or having attended clinical instruction in psychological medicine at a recognized institution during twelve months Further particulars may be obtained from the Secretary Examination Hall S H Queen Square London W C 1

University of Edinburgh (Diploma)

Candidates for the diploma must have held subsequent to graduation (*a*) a resident appointment for one year in a hospital for mental disorders approved by the Faculty or (*b*) a six months appointment as above and six months practical study of nervous diseases in a special or general hospital approved by the Faculty The examination comprises —Part I (1) anatomy of the nervous system (2) physiology of the nervous system (3) psychology and experimental psychology Part II (1) neuropathology (2) clinical psychiatry (3) clinical neurology (4) an additional subject selected by the candidate from a prescribed list Further particulars may be obtained from the Dean of the Faculty of Medicine the University of Edinburgh

University of Leeds (D P M)

The examination is in three parts and is written oral and practical Subjects of examination —Part I (1) the development anatomy and histology (human and comparative) of the nervous system (2) the physiology of the nervous system and of the organs of special sense (3) general psychology Part II (4) the pathology of the nervous system Part III (5) clinical psychiatry (6) experimental and morbid psychology (7) (*a*) clinical neurology (*b*) mental hospital administration (*c*) medico legal aspects of insanity Candidates in order to pass must satisfy the examiners in the practical and clinical parts of the examination in Parts II and III respectively They may present themselves for the three parts of the examination separately or at the same time provided that no candidate shall be allowed to pass in Part II unless he has already passed in Part I or in Part III unless he has already passed in Parts I and II Evidence must be produced by candidates as to attendance at approved courses of instruction before they submit themselves to Part I of the examination Particulars may be obtained from the Academic Sub Dean School of Medicine Leeds

University of Manchester (D P M)

The examination is in two parts Before presenting themselves for either part of the examination candidates must produce evidence of having attended subsequent to qualification certain approved courses of instruction particulars of which may be found in the prospectus of post graduate courses The course of study extends over a period of three university terms two of which must be taken in the university the remaining term may be taken at the university or at some approved institution The subjects of examination are — Part I (1) a written and practical examination on the development anatomy (human and comparative) and physiology of the nervous system (2) a written and practical examination in psychology (theoretical and experimental) Part II (1) a written and practical examination in pathology in relation to the nervous system (2) a written clinical and oral examination in psychological medicine (3) a clinical and oral examination in clinical neurology For further information application should be made to the Dean of the Medical School the University Manchester

University of Durham (D P M)

The examination for the Diploma in Psychiatry consists of two parts Part I anatomy physiology pathology and bacteriology Part II psychology and experimental psychology neurology and psychiatry (systematic and clinical), and candidates may present themselves for the whole examination or for either part separately Particulars of the courses of instruction may be had on application to the Dean College of Medicine University of Durham Newcastle on Tyne

University of Dublin Diploma

A post graduate diploma in psychological medicine is conferred upon registered medical practitioners who have held a resident medical appointment at a recognized institution for the treatment of mental diseases for twelve months or who have held such an appointment for six months and have attended clinical instruction at an approved institution for six months Particulars of special courses of instruction may be obtained from the Registrar of the School of Physic Trinity College Dublin

National University of Ireland Diploma

The National University of Ireland grants a diploma in mental diseases Application should be made to the Registrars of the Constituent Colleges University College Dublin University College Cork and University College Galway for full information

COURSES OF INSTRUCTION

Maudsley Hospital London

A course of instruction for the Diploma in Psychological Medicine is given annually at the Maudsley Hospital Denmark Hill from January to May inclusive the details of the last course being as follows The course consisted of two parts In the first part lectures on the anatomy of the nervous system were given by Professor Le Gros Clark with practical instruction by Mr C Geary A course of lectures on the physiology of the nervous system with demonstrations in physiological psychology was given by Dr J Golla a series of lectures on biochemistry in relation to the nervous system by Dr S A Mann on theoretical and practical psychology by Dr Henry Devine and on mental mechanisms by Dr Aubrey Lewis For the second part of the course lectures on morbid psychology and psychiatry were given by Dr Mapother on the neuroses by Dr R D Gillespie on treatment by Sir Hubert Bond Dr Golla and Dr J S Harris on laboratory methods by Dr Mann and demonstrations on the pathology of the central nervous system by Mr Geary Dr Shrubsall lectured on mental deficiency and Dr East on criminal insanity Dr Golla and Dr James Collier gave instruction on clinical neurology and Mr Foster Moore on eye changes as applied to psychiatry The fee for the whole course (Part I and Part II) was 15 guineas or for either part separately 10 guineas for one single series of lectures in Part I the fee was 4 guineas and in Part II 2 guineas Inquiries as to lectures etc should be addressed to the Director of the Central Pathological Laboratory, Maudsley Hospital Denmark Hill S E 5

Bethlem Royal Hospital

The new Bethlem Hospital has recently been opened at Monks Orchard Eden Park Beckenham Kent where every facility is available for the clinical study of nervous and mental disorder The classification of patients is a prominent feature in the administration of the hospital and treatment in all its modern and specialized aspects can be carried out at the Lord Wakefield of Hythe Treatment and Research Laboratories Two courses of lectures and practical instruction for the Diploma in Psychological Medicine are given each year in spring and autumn These are of an intensive character one commencing in September and completed in early December and the other commencing in the middle of January and ended in the middle of April Each course consists of two parts Part A includes lectures and demonstrations on the anatomy histology and physiology of the nervous system with lectures on psychology and demonstrations in experimental psychology Part B comprises lectures and clinical demonstrations in psychology including lectures and demonstrations in the morbid anatomy of the nervous system a series of lectures with clinical demonstrations on different branches of psychological medicine and lectures with clinical demonstrations on mental deficiency Entrants for the course pay a composition fee of 15 guineas may if due notice is given attend either Part A or Part B of one course and postpone the other

part until the next session. An entrant who wishes to attend one part only pays a fee of 10 guineas. An entrant who takes the complete course can attend the general clinical practice of the hospital on payment of 5 guineas for six months, or 10 guineas for one year, but an entrant who does not take either part of the course and desires to attend the clinical practice of the hospital must pay a fee of 5 guineas for each three months of attendance. To enable post-graduates to obtain special experience in this branch of medicine clinical assistants are appointed from time to time. Further particulars may be obtained from the Physician-Superintendent, Monks Orchard, Eden Park, Beckenham, Kent.

National Hospital, Queen Square

Post-graduate courses which fulfil the requirements of the regulations for the Diploma in Psychological Medicine in regard to instruction in nervous diseases are held at the National Hospital, Queen Square, Bloomsbury, W.C.1, thrice annually, usually during February to March, May to June; and October to November. Lectures on the anatomy, physiology, and pathology of the nervous system and various clinical lectures are delivered and demonstrations are given. Out-patient clinics are held at the hospital on the afternoons of Mondays, Tuesdays, Wednesdays, Thursdays, and Fridays. An inclusive fee of 10 guineas is charged for the whole course, but any part of the course can be taken separately at a special fee. A special arrangement is made for those unable to attend the whole course, and for details applications should be made to the Dean of the Medical School. Fees are payable to the secretary of the hospital on entering for the course.

Tavistock Square Clinic for Functional Nervous Disorders

Courses in the theory and practice of modern psychotherapy are held at this clinic every term. The subjects dealt with include the various schools of analytical psychology, treatment by persuasion and suggestion, differential diagnosis, and physical factors. Syllabus and particulars of dates and fees may be obtained from the Honorary Lecture Secretary at 51, Tavistock Square, London, W.C.1. Clinical assistantships are from time to time available for graduates who have attended such courses. The director of the clinic is Dr. H. Crichton-Miller, the deputy director Dr. J. R. Rees, and there is a large children's department. The "short course" lasts for a fortnight, and consists of twenty lectures, ten case-discussions, and two demonstrations. It is intended for senior students and those engaged in post-graduate study. The "long course" lasts for twelve weeks, and consists of two lectures on Wednesday afternoons. It is intended for senior students, and particularly for general practitioners in the London area.

Particulars of the courses of instruction arranged by the other universities granting the diploma may be obtained on application to the addresses given above (see Diplomas).

MENTAL HOSPITAL APPOINTMENTS

Those who take up psychiatry as a career work as medical officers of public or private mental hospitals or similar institutions. Except in the larger institutions, such as those under the control of the London County Council, where a number of the medical officers are allowed to live out if married, the medical staff are resident officers, having board, lodging, etc., either in the hospital itself or a residence in the grounds. Junior assistant medical officers receive about £300 to £400 per annum, and senior assistant medical officers about £500 to £700, in both cases with board, lodging, laundry, etc., in addition; if married, the board, etc., is commuted for cash. As the mental hospitals are under local control the salaries vary much in different asylums. Medical superintendents, whose pay commonly ranges between £800 and £1,500 per annum, are provided with a house in the grounds of the hospital, and draw various allowances.

Since the passing of the Asylum Officers Superannuation Act of 1909, all officers and others of the established staff of a public (county or borough asylum) mental hospital may retire at the age of 55 on a pension varying from one-half to two-thirds of the value of their pay and emoluments, or one-fiftieth for every year served, paying as contribution 3 per cent. of the value of their appointments annually. This very favourable prospect may not appeal to junior practitioners joining the services, but will eventually prove to be a valuable asset.

PROSPECTS IN THE PUBLIC SERVICE

Appointments to the public mental hospitals are made by the visiting committees, and in most cases only the junior posts are open to those who have not had previous experience in psychiatry. Since the public mental hospital service is a local and, except indirectly, not an imperial one, the promotion tends to be slow and uncertain; and the higher positions are not always advertised and thus thrown open to competition. For this and other reasons mental hospital work has undoubtedly not been in favour with newly qualified men in years past, but the general conditions of service continue to show a progressive improvement.

Both the British Medical Association and the Royal Medico-Psychological Association are working separately and together to improve present conditions of service, and have, for example, already removed the "celibacy" objection to the service. The salaries have also been considerably increased, especially in the junior ranks. During the last few years considerable progress has been made in the conditions under which the insane are treated. The mental hospitals are developing an atmosphere approximating more closely to that of the general hospitals. As a result of these developments the mental hospital service is becoming more attractive, and now affords greater opportunities for the medical graduate who proposes to specialize in psychiatry.

While routine, administrative, and clerical work bulk largely in mental hospital duties, as they do in other public medical services, there is ample material, time, and scope for purely medical work and research—difficult as the subject may be—in psychiatry as one of the branches of medicine open to young graduates. Most mental hospitals are now equipped with efficient clinical laboratories; moreover, those who wish to undertake research are afforded every opportunity of doing so in the pathological department of the Maudsley Hospital and also in various other centres in England and Scotland.

The Public Health Medical Services

The central authority to secure the adoption and effective administration of measures conducive to the health of the people, and to promote research work and the proper training of persons for health services, is the Ministry of Health.

For the purpose of local public health administration the whole of England and Wales is divided into counties, county boroughs, boroughs, and urban and rural sanitary districts. The administrative County of London, exclusive of the City of London, is divided into twenty-eight metropolitan boroughs.

The public health medical services for Great Britain embrace between three and four thousand medical men and women who give whole-time services, and, in addition, a large number who give part-time services. The medical officers appointed for these services may be either medical officers of the Ministry of Health for England and of the corresponding Boards of Health for Scotland and Wales; or—and these form the large majority—they may be medical officers appointed by the many local public health authorities. These latter appointments include: medical officers of health, tuberculosis medical officers, maternity and child welfare medical officers, venereal diseases medical officers, and school medical officers—who must be regarded as working in the health interests of the school child. By the larger public health authorities assistant medical officers of health are also appointed, and these posts often serve as stepping-stones to the higher offices as vacancies, which are required to be advertised, occur.

The Medical Services of the Central Authority

For England, the medical work of the Ministry of Health has been organized under the control of a Chief Medical Officer. It is subdivided into eight sections, with a senior medical officer at the head of each, and about a hundred medical officers, of whom about half are regional and deputy regional medical officers employed for certain duties under the Health Insurance Acts. Briefly, the sections deal with environmental hygiene, epidemiology, and international health; maternity and child welfare; tuberculosis and venereal diseases; the supervision of the food supplies; sanitary administration in relation to infectious diseases; national health insurance; and the school medical service. Vacancies in the staff are advertised from time to time in the medical journals and appointments are made by the Minister on the recommendations of a Selection Committee. These are Civil Service appointments, subject to the usual conditions as to pension, holidays, etc. Medical officers are also employed by the Welsh Board of Health (Cardiff) and the Department of Health for Scotland (Edinburgh).

Medical Officers of Health

The duties of the medical officer of health are: To inform himself upon all influences affecting or threatening to affect, injuriously, the public health within his district; to advise his sanitary authority upon all matters relating to health; and to perform all the duties imposed upon him by statutes, by-laws, and regulations. He must prepare and submit to his local authority special and annual reports; give immediate information to the Ministry of Health of any serious outbreak of disease; and, subject to the instruction of his sanitary authority, he shall direct or superintend the work of sanitary inspection.

By the Sanitary Officers Order, 1926, no person is qualified to be hereafter appointed or reappointed as a medical officer of health of any district or combination of districts unless, in addition to the qualifications prescribed by any statute, he is also either registered in the *Medical Register* as the holder of a Diploma in Public Health, Sanitary Science, or State Medicine, or has had not less than three years' previous experience of the duties of a medical officer of health.

The Public Health (Officers) Act, 1921, which was promoted by the British Medical Association, provides that a whole-time medical officer of health of a county borough or urban and rural district in England and Wales, a part of whose salary is contributed by the Exchequer, shall not be appointed for a limited period, and shall not be removed from his office except by or with the consent of the Minister of Health. A similar security of tenure also applies to all medical officers of health of county councils and of London boroughs.

Under the Sanitary Officers Order, 1926, a medical officer of health who does *not* devote his whole time to the duties of his office, but a portion of whose salary is obtained from Exchequer grant, may be appointed without limit of time, in which case he cannot be removed from office without the consent of the Minister. If he is appointed for a specified term, say one year, he continues to hold office from year to year unless the Minister consents to his removal. Where the electing body pays the whole of the salary of such a medical officer of health he may be dismissed from office without reference to the Minister of Health.

A considerable number of authorities have now adopted the Local Government and Other Officers Superannuation Act 1922. Under this Act, if an officer is incapacitated by ill health after ten years of service, or if he has reached 65 years of age, he is entitled to superannuation on the following scale: after ten years' service, 10/60 of the average salary which he received during the last five years of employment, after eleven years, 11/60, and so on up to a maximum of 40/60 after forty years or more of service. This Act, however, remains permissive, and it fails to make due allowance, in computing service for purposes of superannuation, for the more advanced age, as compared with other officials, at which the medical officer of health can enter the public service. In these two respects the position reached falls short of that for which the British Medical Association has been working for some years.

In Scotland the position is different in some respects. Under the Public Health (Scotland) Act, 1897, no one can be appointed as medical officer of health for any area unless he possesses the Diploma in Public Health. No medical officer can be removed from office except with the sanction of the Board of Health. A "proper" salary must be paid, and the local authority may not bring about the resignation of the officer by indirect means, such as reducing the salary or attaching new conditions to the appointment. The Act says nothing about superannuation or the age of retirement.

School Medical Officers

School medical officers are appointed by local education authorities. Primarily their duty is to detect among the children attending the public elementary schools any physical or mental defect which may retard education, and to inform the parents of its existence. Most approved schemes of medical inspection include arrangements which facilitate the task of parents in obtaining for their children the necessary treatment, check the results of this treatment, and keep each defective child under skilled observation both at home and at school until it has passed altogether out of the education authorities' hands. Indeed it is now the practice for the education authorities themselves to provide for certain ameliorative work, notably the prescription of glasses where necessary, dental treatment, the removal of adenoids and tonsils, and treatment in connexion with certain diseases of the skin and some physical and mental defects. The general effect of all schemes alike is to make the inspection imposed by law of benefit not merely to the individual child but to the community at large by preventing the development of conditions which lead to the existence of inefficient citizens among the adult population. The work is so related to that of medical officers of health that generally the senior school medical officer fills both appointments, his work when necessary being supplemented by that of whole or part time assistants. A diploma in public health is almost always required of those entering the school medical service.

In Scotland, while the statutory authority for the work of the school medical service is different, the scheme of work is broadly the same.

Tuberculosis Medical Officers

A tuberculosis medical officer is an officer with special training and experience in tuberculosis work, and of a suitable age and attainments to command general confidence. In England such officers are appointed by county councils and county borough councils, and their duties are to carry out the work of diagnosis of tuberculosis, to advise as to treatment, and to take charge of the work of tuberculosis dispensaries and sanatoriums where these are in operation. The work under tuberculosis schemes is co-ordinated with the general public health work of local authorities, and so the medical officer of health is often appointed as the chief tuberculosis officer when a special tuberculosis officer is on the staff of the local authority. The arrangements in Scotland are very similar. In Wales tuberculosis work is carried out under the aegis of the Welsh National Memorial Association, upon which the constituent local authorities are represented, and the appointments of tuberculosis officers are vested in the Association.

Maternity and Child Welfare Medical Officers

Any local public health authority, however small, may make arrangements for maternity and child welfare work within its area, although very generally the smaller local authorities are provided for in county council schemes. For the schemes of the smaller local authorities the services of a part-time medical officer are obtained when the medical officer of health does not himself undertake the duties, but for the larger schemes special whole-time appointments are made. The maternity and child welfare

medical officer is responsible for the work at the centres provided and for directing the home visitations ; and these activities are closely co-ordinated with the other branches of public health work directed by the medical officer of health.

Much of this work was commenced in different parts of the country by voluntary organizations ; some of it still remains in their hands, and is only loosely linked up with the public health local authority ; but the tendency is for the whole of it to be undertaken by the local authorities. A large number of women medical officers have been appointed to these posts.

VENEREAL DISEASES OFFICERS

Schemes for the diagnosis and treatment of venereal diseases are provided and administered by county councils and county borough councils. In some cases the officer is on the whole-time public health staff, and in others he is a part-time official. Special knowledge and practical experience in the treatment of venereal diseases are essential. The officer appointed for either whole-time or part-time service works at one or more clinics, and also gives instruction and assistance in the treatment of venereal diseases to general practitioners, who are allowed to attend the clinics.

REMUNERATION IN THE PUBLIC HEALTH SERVICE

In order to ensure that public health authorities may obtain skilled and highly trained medical officers it is essential that such officers should receive salaries commensurate with their attainments, bearing a reasonable relationship to the time and money expended in fitting them for their important and responsible duties, and comparing well with the income which might be secured in other lines of medical work. With this end in view the British Medical Association and the Society of Medical Officers of Health prepared a scale of minimum commencing salaries for whole-time public health medical officers.

The scale, which was put into operation in 1925, was attended with a large measure of success. There were, however, certain aspects of it which were not entirely satisfactory. For instance, it was not retrospective, and did not, therefore, apply to medical officers who had been appointed prior to the date on which it came into force, and it contained no provision for specified increments in salary.

As the result of a series of conferences between representatives of the various Associations of Local Authorities and the British Medical Association and Society of Medical Officers of Health, under the chairmanship of Lord Askwith, a "Memorandum of Recommendations" in regard to salaries of public health medical officers has been drawn up and came into force in June of last year. This Memorandum was published in the *Supplement* to the *British Medical Journal* of July 27th, 1929 (p. 71). It has been adopted by the Representative Body and has been accepted by the representatives of the following bodies representing local authorities:

The Association of Municipal Corporations.
The Urban District Councils Association.
The Rural District Councils Association.
The London County Council.
The Association of Education Committees.
The Mental Hospitals Association.
The Metropolitan Boroughs Standing Joint Committee.

Unfortunately it has not been accepted by the county councils as a whole, but a recent examination of the position showed that a majority of these authorities have now adopted, and are applying, the Memorandum. The advertisements of local authorities who are not prepared to put into effect the whole of the Recommendations will not be published by the *British Medical Journal*, which in this matter has the co-operation of the *Lancet* and the *Medical Officer*.

The great advantage of the Memorandum is that it embodies a general agreement as to salaries and conditions of service, and is not merely a scale of salaries. It is retrospective, and will therefore benefit officers appointed before it came into force. It provides stated increments for practically all medical officials except whole-time chief medical officers of health, who, as the chief medical officials, may, it is presumed, depend that the commencing salaries mentioned in the agreement will be increased for meritorious work and years of service, and it contains a very valuable provision by which questions of difficulty can be referred to an advisory committee.

For the right class of practitioner with leanings in the direction of public health work the service offers an attractive career, but it must always be remembered that there are comparatively few posts which carry high salaries.

The Curriculum for the Diploma in Public Health.

The new Regulations and Rules of the General Medical Council for Diplomas or Degrees in Public Health come into force on October 1st, 1931.

The curriculum must extend over a period of not less than twelve calendar months (or an academic year of whole-time study covering a period of not less than nine calendar months) subsequent to the attainment of a registrable qualification.

Every candidate for Part I must produce evidence of having attended, during not less than 280 hours, at an institution approved by the licensing body granting the diploma, practical instruction in:

(*a*) Bacteriology and parasitology (including immunology, serology, medical entomology, etc.), especially in their relation to diseases of man, and to those diseases of the lower animals which are transmissible to man ;
(*b*) Chemistry, physics, radiology, and electrology in relation to public health ;
(*c*) Physiology and biochemistry in their application to nutrition and hygiene ;
(*d*) Meteorology and climatology in relation to public health.

Every candidate for Part II must produce evidence of having received, during not less than 120 hours, at an approved institution, instruction in the following subjects:

(*a*) The principles of public health and sanitation ;
(*b*) Epidemiology and vital statistics ;
(*c*) Sanitary law and administration (including public medical services) ;
(*d*) Sanitary construction and planning.

Every such candidate must also have attended for three months on the clinical practice of a recognized hospital for infectious diseases, and have received therein instruction in the methods of administration. At least twenty-four daily attendances of not less than two hours each are required.

Every candidate for Part II must produce evidence that he has, during a period of not less than six months, been engaged in acquiring a practical knowledge of the duties of public health administration under the supervision of a medical officer of health, who must certify that the candidate has received, during not less than three hours on each of sixty working days, practical instruction in these duties, and also those relating to:

(*a*) Maternity and child welfare service ;
(*b*) Health service for children of school age ;
(*c*) Venereal diseases service ;
(*d*) Tuberculosis service ;
(*e*) Industrial hygiene ;
(*f*) Inspection and control of food, including meat and milk.

(Instruction in (*a*) to (*f*) must include attendance at the centres, clinics, institutions, and premises concerned.)

Certificates of having received the prescribed instruction in public health administration must be given by a medical officer of health who devotes his whole time to public health work ; or by the medical officer of health of a sanitary area having a population of not less than 50,000 ; or in Ireland by the medical superintendent officer of health of a county or county borough having a population of not less than 50,000.

THE REGULATIONS FOR THE DIPLOMA IN PUBLIC HEALTH

The Examination

The examination for the D.P.H. is divided into two parts, and no candidate is allowed to sit for the final part until after an interval of two years from the date of his obtaining a registrable medical qualification, which must

be registered in the *Medical Register* before admission to Part II of the examination The object of this two years' interval is " to provide opportunity for candidates, while passing from the state of pupilage to that of responsible practice to give mature consideration to the obligations and duties involved in the work of the Public Health Service, and to acquire direct experience of medical work in a responsible capacity, in general medical practice, in hospital or laboratory appointments, or in any special branch of clinical work or study related to State Medicine "

The examination for Part I embraces practical, written, and oral tests in the subjects set out in the Regulations of the curriculum relating to that part , and the same is true of the examination for Part II

A candidate must pass in all the subjects of Part I before being admitted to the examination for Part II

Any candidate who possesses a qualification entitling him to registration on the British, Dominion, or Foreign List of the *Medical Register* can be admitted to examination, provided he has complied with the regulations of a licensing body in the United Kingdom based on the rules of the General Medical Council, and that before being admitted to Part II of the examination his qualification has been registered in the United Kingdom Only diplomas in public health granted by approved bodies in the United Kingdom are registrable in the *Medical Register*

TRAINING AND EXAMINING CENTRES FOR PUBLIC HEALTH QUALIFICATIONS

Degrees in Sanitary Science are conferred, in England, by the Universities of London, Durham, Liverpool, and Birmingham , in Scotland, by the Universities of Glasgow and Edinburgh , and in the Irish Free State, by the National University of Ireland In most cases these degrees are conferred only upon medical graduates of the universities granting them

Whereas for the Diploma of Public Health the requirements of the General Medical Council are strictly conformed to, these requirements are extended, as a rule, as to both the period and the scope of special studies demanded, before Degrees in Sanitary Science are granted

Most universities in Great Britain and Ireland grant a D P H and provide for the necessary training The English and Scottish Conjoint Boards and the Irish Colleges also grant these diplomas

The School of Physic of Trinity College, Dublin, was the first body in the British Isles to arrange for courses of instruction and for a Diploma in Public Health

At Cambridge the teaching and training courses for the D P H cease this month but the university will continue to hold examinations for the diploma

The post-graduate teaching and training in public health, in London, is provided mainly at one centre—the London School of Hygiene and Tropical Medicine (University of London), the only other training centre which offers such facilities being the Royal Institute of Public Health

The course of study for the D P H , as provided by the London School of Hygiene and Tropical Medicine (Keppel Street, Gower Street, London, W C 1), covers a period of nine calendar months in the case of whole time students and is so designed that students wishing to do so can proceed to the new academic diploma instituted by the University of London The School undertakes research work in preventive medicine, and members of the public health services have a common room placed at their disposal, and are privileged to attend staff and special lectures

The University of Manchester has a well equipped department of bacteriology and preventive medicine, where candidates preparing for the examinations of the various university and examining boards for the Diploma in Public Health can obtain instruction It also prepares candidates for the Diploma in Bacteriology and in Veterinary State Medicine, granted by the university, and for its Certificates in Factory Hygiene and School Hygiene Full particulars can be obtained from the Dean of the Medical School, the University, Manchester

The University of Edinburgh grants a Diploma in Public Health The course, which extends over an academical year of nine months full time study, can be commenced in October only, and provision is made by the university for instruction in all the subjects Candidates for the diploma must be graduates in medicine and surgery of the University of Edinburgh or must hold corresponding degrees or registrable medical qualifications, which must be registered before a candidate is admitted to examination The course for the diploma is divided into two parts, for each of which examinations are held twice annually In each part the candidate must pass in all the specified subjects at one examination Admission to the examinations is contingent upon the candidate having complied with the following conditions

PART I.—*(a)* Completion subsequent to obtaining a registrable medical qualification of the course of instruction prescribed for Part I

PART II.—*(b)* Completion subsequent to obtaining a registrable medical qualification of the course of instruction prescribed for Part II *(c)* Lapse of two years after obtaining a registrable medical qualification *(d)* Previous passage of examination in all subjects of Part I

Further particulars can be obtained from the Dean of the Faculty of Medicine Edinburgh

The Royal Naval Medical College and the Royal Army Medical College provide courses of training to the medical officers of these two services

Degrees and Diplomas in Public Health are registrable qualifications, but not so those in Tropical Medicine and Hygiene

QUALIFICATIONS IN TROPICAL MEDICINE AND HYGIENE

The University of London grants a degree (M D in Tropical Medicine) to its medical graduates and the course of training required must extend over at least one academic year

Diplomas in Tropical Medicine and Hygiene are granted, in England, by the University of Liverpool and by the English Conjoint Board , and, in Scotland by the University of Edinburgh Among the institutions which provide qualifying courses are the London School of Hygiene and Tropical Medicine, the Liverpool School of Tropical Medicine, and the Royal Army Medical College In the last mentioned institution the training provided is restricted to army medical officers The training period for these diplomas is about six months Graduates of medicine and surgery of recognized universities whose degrees are not registrable in this country may enter for the examination of the English Conjoint Board, and the conditions of study may be modified on the grounds of previous work in the Tropics or of original investigations undertaken

The Colonial Office has decreed recently that the holder of a D T M and H , or of a D T H , is eligible for appointment as a medical officer of health in places and districts other than those with large populations In the latter cases a D P H is required

Those wishing for the details of syllabus of study, fees, date of commencement of the training courses, and the dates of examinations, etc , should apply to any of the training schools mentioned

The Services

ROYAL NAVAL MEDICAL SERVICE

Examinations for direct entry into the Royal Naval Medical Service are at present in abeyance Entries are made by means of the short service scheme

General Conditions of the Short service Scheme

A candidate must be registered must be under 30 years of age and must be recommended by the dean of his school if however the candidate intends to apply for transfer to the permanent list he must have been under 28 years of age at the time of his entry He must be a British subject of pure European descent Unmarried candidates will be preferred A candidate will be interviewed by the Medical Director General R N and will undergo a physical examination If

considered eligible by the Medical Director-General his name will be submitted to the Board of Admiralty, and he may be appointed "surgeon lieutenant for short service" A candidate must engage for three years, with the option of continuing for a further period of twelve months if his services are still required The present rate of pay is £444 a year, with the same allowances as are payable to permanent officers of their rank Lodging money at the rate of £80 a year is usually allowed when employed on shore, without quarters in the United Kingdom and £56 10s a year in lieu of rations when not victualled in kind On joining an allowance of £50 for uniform is made

An officer engaged for three years is entitled to receive two months' notice of his services being no longer required A gratuity of £8 6s 8d will be payable to officers for each completed month of service on completion of their period of service, or to any who are invalided for causes not within their own control before the completion of the prescribed period

Transfer to Permanent Service

A short service surgeon lieutenant, after six months' service, may be considered, on application to the Secretary of the Admiralty, for transfer to the permanent service, and would be permitted to count his seniority from the date of entry for short service for purposes of promotion increment of full pay, and for retired pay, but for purposes of retiring gratuity on the permanent officers' scale his services will reckon only from the date of transfer to the permanent list

Antedates of Seniority on Account of Civil Hospital Appointments held before Entry

Officers who have held appointments as medical or surgical officers in civil hospitals for any period prior to entry, after becoming qualified medical practitioners, are eligible to have their seniorities antedated by not more than one year The eligibility of appointments in civil hospitals to count for time will be decided by the Medical Director General of the Navy

The increase of seniority will count for the purpose of increase of full and retired pay, etc, as from date of transfer to the permanent list in the case of surgeon lieutenants for short service Short service surgeon lieutenants claiming antedates of seniority must apply for transfer within eighteen months of entry

Promotion

Promotion to surgeon commander is attained on completion of twelve years' service, and officers of that rank are selected for promotion to the twenty seven higher ranks (surgeon captain surgeon rear admiral, and Medical Director General) as vacancies occur

Officers obtaining more than 75 per cent of marks at the examinations held at the termination of Parts I and II of the course for promotion to surgeon commander are eligible for advances of seniority as follows Over 75 per cent marks, 12 months over 85 per cent marks 18 months

Special promotions (limited in number) may be made to the ranks of surgeon commander and surgeon lieutenant commander in cases of distinguished service or conspicuous professional merit

Medals and Prizes

The Gilbert Blane Medal awarded annually to the surgeon lieutenant commander who obtains the highest aggregate marks at the examination for promotion to the rank of surgeon commander, and the Chadwick Naval Prize the North Persian Forces Memorial Medal and the Parkes Memorial Prize are open to naval medical officers

Post Graduate Instruction in the Naval Medical Service

Course on Entry—A course of two months' duration at the Royal Naval Hospital, Haslar, is given to each short service officer on entry

General Professional Courses—These courses at the Royal Naval Hospital Haslar, of four months duration, are normally arranged for officers lower than surgeon captain's rank once in every four years The subjects of these courses of instruction are clinical medicine and surgery and allied subjects, and on the completion of the courses officers are appointed to a large naval hospital unless and until they receive appointments elsewhere

Course for Promotion to Surgeon Commander—This course, of five months' duration, is normally taken by officers of six to eight years' service Three months of the course are spent at the London Hospital, and two months at the Naval Medical School, Royal Naval College, Greenwich

Specialist Courses—These courses, of three to six months' duration, are arranged at recognized civil teaching centres for officers selected for specialist posts, and officers will subsequently undergo courses of three months' duration in the special subjects every four years while employed as specialists

Post Graduate Courses (Old Scheme)—The existing three months' post graduate courses at civil hospitals will to a limited extent, be superseded by the general professional and special courses described above, but they will not be discontinued until the new courses have been in operation for some years

Medical officers R N are given the opportunity to prepare for and take higher or specialist qualifications—for example M D, M R C P, F R C S, D P H, D T M, etc

Rates of Pay

The current rates of full pay and retired pay are stated below They represent a deduction of 8 per cent from the standard rates which were fixed in 1920, when the cost of living was high, 20 per cent of the standard rate is regarded as variable as the cost of living rises or falls

Full Pay

	Per annum £
Surgeon Lieutenant (short service and permanent service)	444 to 487
Surgeon Lieutenant Commander (promoted after 6 years service)	587 to 631
Surgeon Commander (promoted after a further 6 years service)	734 to 913
Surgeon Captain (promoted by selection)	1,092 to 1,141
Surgeon Rear Admiral (promoted by selection)	1,704
Medical Director-General (Surgeon Vice Admiral)	2,300

There are also in certain cases allowances which form a substantial addition to the rates of pay There are sixty specialist appointments open to medical officers They comprise specialist posts in medicine, surgery, diseases of the eye, ear nose and throat, radiology hygiene etc, and in addition at the rate of 5s a day is payable to holders of them

Medical officers in charge of naval hospitals and sick quarters receive charge pay on the following scale

Surgeon Rear Admirals and Surgeon Captains	10s a day
Surgeon Commanders	5s a day

Maximum Retired Pay

(Approximate current rates)

	£	Age for compulsory retirement
Surgeon Vice Admiral	1,100	On vacating post
Surgeon Rear Admiral	929	60
Surgeon Captain	825	55

,, 16 ,, ,, ,,	2,250

Further Particulars

Full particulars and a form of declaration can be obtained from the Medical Director-General, Admiralty, Queen Anne's Chambers Tothill Street, London, S W 1

ARMY MEDICAL SERVICES

Entrance to the Royal Army Medical Corps, either by competitive examination or by selection, as decided by the Army Council, will take place half-yearly, in January and July The examinations in medicine and surgery are entirely of a clinical and practical character, partly written and partly oral

In addition to the grant of permanent commissions the War Office offers a number of temporary commissions in the R A M C, the holders of which may be invalided at the end of twelve months' service (if suitable, and provided that vacancies exist) to accept permanent commissions in the Royal Army Medical Corps If a permanent commission is accepted the temporary service is allowed to count as the equivalent of permanent service for promotion, increase of pay, and retired pay The

Pay and Allowances at Home

*Pay Warrant rates less 8 per cent., with effect from July 1st, 1931. The Pay Warrant rates are subject to revision to an extent not exceeding 20 per cent., according to variation in the cost of living. The next revision takes place from July 1st, 1933.
Rates of Allowances vary from time to time, and issues are subject to conditions laid down in the Allowance Regulations.

conditions enable the young medical man to make acquaintance with army life, without detriment to his ultimate prospects, before deciding whether to make a permanent career in the R.A.M.C.

The regulations for admission, giving full details, can be obtained from the Under Secretary of State (A.M.D.1), War Office, Whitehall, London, S.W.1, and should be carefully studied. A personal interview with a representative of the Director-General, Army Medical Services, is readily obtainable. The work is varied, responsible, and interesting. The gratuities after certain periods of service enable an officer, should he so desire, to leave the service with a capital sum large enough to go some way towards re-establishing himself in civil life.

New entrants, who must be 22 and not over 28 years of age, are commissioned in the rank of lieutenant; the first six months of service are spent on probation, during which time, in addition to their military training at the Royal Army Medical Corps Depot at Aldershot, they undergo a probationary course at the Royal Army Medical College in London, in hygiene, pathology, tropical medicine, military surgery, recruiting, the prevention and treatment of venereal disease, and the elements of army administration. At the end of this course, and after qualifying at the necessary examinations, their commissions are confirmed and they take their places in seniority according to the total marks obtained at all examinations up to that date. Officers Training Corps service, with possession of certificate "B" (medical), carries a definite value in marks in this total.

An entrant who is holding or about to hold at the time of the entrance examination an approved whole-time appointment at a recognized civil hospital may be seconded while holding such an appointment up to a maximum period of twelve months. A candidate who has held such an appointment within six months of entry may be granted an antedate up to twelve months in respect of the period the appointment was held. This secondment and antedate count in all respects as commissioned service, except that pay will not be issued for that period.

After a total period of one year's service at home, the young officer goes abroad, probably to India, for his first tour of foreign service. Here he gains his first practical experience of tropical disease and tropical hygiene, and possibly his first experience of active service on the frontiers of India. His tour abroad lasts five years, with probably six months' leave home during that time. On returning home the R.A.M.C. officer has the opportunity to decide whether he will remain in the Corps or accept the gratuity of £1,000 after seven years' service and try his fortune in civil life. If he elects to remain, he will, between his eighth and twelfth year of service, undergo a course of post-graduate study at the Royal Army Medical College and the London hospitals of five months' duration, followed by a course of study of a special subject selected by himself, provided he has shown special aptitude in the post-graduate course or during his previous service. During the period of study he remains on full pay and the fees of the course are paid by the State. When qualified in his special subject the officer is eligible for a specialist appointment. The total number of these appointments is 108, and the additional rate of pay 4s. 8d. a day. After this post-graduate course the officer probably proceeds abroad again, and promotion to major rapidly ensues; from that time onward he receives regular successive increases of pay and is eligible for additional and charge pay as well. Directorates of hygiene and pathology, and the appointment of two serving officers as consultants in medicine and surgery, have been instituted, and have proved a marked success. All these appointments are of the rank of colonel or major-general, and were devised to permit specially selected officers to rise through all ranks to that of major-general on the strength of their professional or purely scientific work.

Promotion

Promotion takes place automatically to captain after three and a half years' and to major after twelve years' service, provided the officer is qualified and recommended for promotion. Promotion to the higher ranks is by selection from those senior in the rank below, but special promotion by brevet or otherwise is open to officers of the Royal Army Medical Corps.

Pay and Allowances

The rates of pay and allowances are given in the table printed above. In addition, an officer at home in charge of a hospital receives charge pay, the daily amounts being from 2s. 6d. to 10s., according to the number of beds. There are other appointments for which charge pay is given from 5s. to 10s. daily.

Retirement and Retired Pay

Retired pay will consist of two parts. (*a*) a service element based on the officer's total service; (*b*) a rank element for the substantive rank from which the officer retires. An officer with less than twenty complete years' service will not be

Rates of Pay for R.A.M.C. Officers Serving in India

Rank	Rates of Pay per Month						
	Unmarried			Married			
	Pay of Rank	Unmarried Rates of Lodging Allowance	Total	Pay of Rank	Married Rates of Lodging Allowance	Marriage Allowance	Total
	Rupees.	Rupees.	Rupees.	Rupees	Rupees.	Rupees	Rupees

Lieutenant-Colonel	1575	75	1650	1575	150	75	1800
Lieutenant-Colonel after 3 years' service	17 0	75	1825	1750	150	75	1975

* Married rate of pay is not admissible to officers whose age is under 30.

eligible for retired pay on voluntary retirement. The scale, subject to the reduction of 8 per cent. referred to below, is, for the service element, £15 a year for each completed year of service as a medical officer. For the rank element the scale is as follows:

Substantive Rank from which Retired	After Completing 1 Year's Service in the Rank	After Completing each Additional Year's Service	Maximum Rank Element
	£	£	£
Major	12	12	120
Lieutenant-Colonel . ..	150	30	240
Colonel	290	50	390
Major-General .. .	440	50	540
Lieutenant-General .	590	50	690

The retired pay of an officer retiring with less than one complete year's service in the rank from which he retires will be assessed as though he had retired from the rank below.

The maximum standard rates of retired pay are as follows:

Captain and Subaltern -	£300
Major	£450
Lieutenant-Colonel .. .	£600
Colonel .. .	£800
Major-General .	£1,000
Lieutenant-General	£1,200

The above rates are those laid down in the Pay Warrant. They have been reduced by 8 per cent as from July 1st, 1931, 20 per cent. of the standard rate is regarded as variable as the cost of living rises or falls

Officers with seven and less than twenty years' service as medical officers may be permitted to retire with a gratuity in accordance with the following scale

After 7 years' service as a medical officer	£1,000
After 15 years' service as a medical officer	£2,800
After 18 years' service as a medical officer	£3,500

Seconded Service

An officer may be permitted to accept employment under the Foreign or Colonial Offices; when so seconded he is not eligible for pay or allowances from Army funds, but his service continues to reckon towards promotion and, under certain conditions, towards increase of pay, pension, or gratuity.

THE ARMY DENTAL CORPS

The corps is administered by the Director-General, Army Medical Services The regulations for admission to the Army Dental Corps should be obtained from the Under Secretary of State, War Office, and carefully studied.

ROYAL AIR FORCE MEDICAL SERVICE

The Air Council attaches great importance to attracting into the R.A.F.M.S. the best type of medical man, since on the capacity of the medical service depends in a peculiar degree the safety and efficiency of the Royal Air Force. The duties of these medical officers include not only the prevention and treatment of those ordinary diseases to which the personnel of any fighting service are liable, but the special study of the mental and physical stresses imposed on the airman in diverse circumstances and climates—a new branch of medicine which still provides considerable scope for research.

As promotion to the higher medical ranks is by selection from officers who are eligible by reason of length of service, and as a certain proportion of the higher ranks will be reserved for purely professional as opposed to administrative appointments, it will be seen that there are excellent prospects for the young medical officer who exhibits ability and energy in professional work as well as for those who develop a talent for administration Duties will, as a matter of course, give him flying experience as a passenger, which is necessary for the proper study of the medical problems of aviation and for gaining first-hand knowledge of the conditions under which his comrades serve.

The establishment of the Royal Air Force Medical Service consists partly of permanent and partly of short-service officers

An officer will, on first entry, be granted a short service commission for a period of three years on the active list (which may be extended to five years at the discretion of the Air Council, if the officer so wishes, on the recommendation of the Director of Medical Services) and of four years in the Reserve of Air Force Officers. Selections for permanent commissions will be made from officers holding short service commissions, and those who are not selected will be transferred to the Reserve at the expiration of their period of service on the active list. For those entrants who desire it the prospect of obtaining a permanent commission is approximately an even one.

Arrangements are in force under which an officer granted a short-service commission who has previously held an approved whole-time appointment in a recognized civil hospital may, subject to certain conditions, be granted an antedate of the commission equal to a period of the appointment up to a maximum of one year. A similar arrangement obtains as regards a recognized hospital appointment which is held or about to be held at the date when the short service commission is granted.

*Except for periods of service under Indian administration. For such periods officers receive pay and allowances at rates and subject to conditions authorized from time to time by the Government of India.

†These allowances are issued only when accommodation, fuel and light, rations and personal attendance are not available in kind. Normally, provision in kind is available for junior officers. "Married" rates of allowances are payable only to married officers who have reached the age of 30 or the rank of squadron leader. Rates of allowances abroad are fixed in relation to costs in the particular country, and a colonial allowance is granted in certain commands abroad. The rates and general scheme of allowances are liable to revision as circumstances may require.

An officer who has been seconded or whose commission has been antedated as above will be required to serve for a minimum period of three years on the active list from the date of joining for actual R.A.F. duty.

Officers who have been granted permanent commissions may be permitted to attend, for a period not exceeding nine months, a post-graduate course in general medicine and surgery, tropical and preventive medicine, and other special subjects. Such permission may be granted at any time when the exigencies of the service permit during the first sixteen years of service, and when attending these courses officers will receive full pay and allowances.

New entrants into the R.A.F.M.S. will be commissioned as Flying Officers (Medical), and will be eligible for promotion to the rank of Flight Lieutenant (Medical) after two years' service. Officers selected for permanent commissions will normally be promoted to the rank of Squadron Leader after ten years' total service. Accelerated promotion may be granted in a limited number of cases to officers who show exceptional ability after the completion of eight years' service. Promotion within establishment to the rank of Wing Commander will be by selection at any period after sixteen years' total service, and to that of Group Captain by selection at any period after twenty-two years' service.

There will be no competitive examination on entry; candidates must be under 28 years of age, be British subjects, the sons of British subjects, and of pure European descent, and will be interviewed by a Selection Board at the Air Ministry, London, presided over by the Director of Medical Services, Royal Air Force, before acceptance, and will be required to pass a medical examination.

On appointment entrants will undergo an initial course, during which they will be given instruction in the special medical aspects of aviation; the organization and administration of the Royal Air Force; and the general and special duties to be performed by officers in the Medical Branch.

Outfit Allowance

An allowance of £50 towards the cost of uniform is made on joining to candidates who have not had previous service as an officer in H.M. Forces or whose previous service was terminated more than three years before the date of their new commission.

Pay and Allowances

The emoluments of medical officers of the Royal Air Force are given in outline above. The rates of pay are fixed on an inclusive basis, and the fact that specialist pay and charge pay are not payable as separate emoluments was taken into account when the rates were fixed. The standard rates of pay and retired pay were drawn up on the basis of the high cost of living in 1919, and 20 per cent. of each standard rate is detachable and subject to alteration upward or downward in relation to the increase or decrease of the cost of living above or below the cost in July, 1919. Under this provision the current rates now in force represent a reduction of approximately 8 per cent. on the standard rates. The next cost of living revision will take effect from July 1st, 1933.

Retired Pay

The minimum period of service qualifying for retirement on retired pay is twenty years. Standard rates of retired pay are as follows:

Air Officers.—Air Vice-Marshal, £790 to £1,010 per annum; Air Commodore, £650 to £950 per annum.

RETIRED PAY (PERMANENT OFFICERS)
Officers Below Air Rank

Age on Retirement	Standard Yearly Rate of Retired Pay	Years of Service	Addition for each Extra Year of Service*	Deduction for each Deficient Year of Service*
	£		£	£
40	300	17	15	15
41	337	17	15	15
42	375	18	15	15
43	412	18	15	15
44	450	19	15	15
45	487	19	15	15
46	525	20	15	15
47	562	20	15	15
48	600	21	15	15
49	637	21	15	15
50	675	22	15	15
51	697	22	22	15
52	720	23	22	15
53	742	23	22	15
54	765	24	22	15
55	790	24	22	15

*Limited to five years.

The maximum standard rates of retired pay and the compulsory retiring ages for the several ranks are:

Rank	Yearly Rate of Retired Pay	Compulsory Retiring Age
	£	
Air Vice-Marshal	1,010	60
Air Commodore	950	57
Group Captain	900	55
Wing Commander	600	51
Squadron Leader	500	48

Gratuities

A permanent officer allowed to retire before having qualified for retired pay may be granted a gratuity provided he has not less than ten years' commissioned service—namely, £1,500 if he has ten but less than fifteen years' commissioned service; £2,500 after fifteen or more than fifteen years'.

Short-service officers will be eligible on passing to the Reserve for gratuities on the following scale: £100 for each of the first two complete years of service, £150 for each of the third and fourth complete years, and £200 for the fifth complete year; that is, for three years' service on the active list £350; for five years' £700.

These gratuities will not be payable to officers granted permanent commissions, but their service on a short-service commission will count towards retired pay.

Further particulars may be obtained on application to the Secretary, Air Ministry (D.M.S.), Adastral House, Kingsway, W.C.2.

INDIAN MEDICAL SERVICE

Pending a decision on the main constitutional issues now under consideration, the future of the Indian Services necessarily remains in doubt, and the Indian Medical Service is no exception to the general rule. The conditions of service actually in force in the I.M.S. at the present time are in the main those approved by the Association in 1928, but they were based on the decision that, while the I.M.S. would be retained primarily to meet the needs of the Indian Army, Provincial Governments would be required to employ a stated number of officers from the Service, in order to maintain the necessary minimum war reserve and to provide European medical attendance for European officers of the higher civil services and their families. A number of civil posts under the Government of India and the Provincial Governments were therefore reserved for officers of the Service, some being open alike to Europeans and Indians, others to Europeans only, and these posts are actually so reserved under existing regulations. But the recommendations of the Services Subcommittee of the Round Table Conference, presented to the committee of the whole Conference on January 16th, 1931, strike not only at the admittedly temporary numerical adjustment embodied in the regulations, but at the whole basis of the settlement. Subject to the necessary safeguards for the rights of the existing personnel of the Service, the majority of the subcommittee recommended that in future there should be no civil branch of the I.M.S., and that no civil appointments, either under the Government of India or the Provincial Governments, should be listed as reserved for Europeans as such. In their opinion the civil medical services should in future be recruited through the Public Service Commissions.

In view of the terms of these recommendations it is clearly impossible at present to state what, if any, prospects of employment on the civil side will be open to I.M.S. officers under the constitution eventually to be adopted in India. In these circumstances, while candidates for the I.M.S. should understand that they will be liable, if appointed, for military or civil employment as required, it seems advisable to confine attention to the prospects afforded by the military side of the Service which has medical charge of the Indian Army, and which continues to offer wide opportunities of professional experience, including clinical, preventive, specialist, and research work.

Conditions of Service

European candidates for admission to the I.M.S. must be British subjects under 32 years of age, and must be registered under the Medical Acts in Great Britain and Northern Ireland. A gratuity of £1,000 on retirement after six years' service, or £2,500 after twelve years' service, together with free return passages, is offered.

Promotion is on a time scale up to the rank of Lieutenant-Colonel, and by selection to the ranks of Colonel and Major-General.

The monthly rates of pay for European officers in the Service who have a "non-Asiatic" domicile are as follows:

Rank	Service in Rank	Basic Pay	Overseas Pay	Years' Total Service
1	2	3	4	5
		Rs.	Rs.	
Lieutenant		500	150 150	1st 2nd
Captain ...	(i) During first 3 years' service as Captain	650	150 £15	3rd 4th
	(ii) With more than 3 and less than 6 years' service as Captain	750	£15 £25 £25	5th 6th 7th
	(iii) With more than 6 years' service as Captain	850	£25 £25 £25	8th 9th 10th
Major ...	(i) During first 3 years' service as Major	950	£30	11th
	(ii) With more than 3 and less than 6 years' service as Major	1100		12th
	(iii) With more than 6 years' service as Major	1250		
Lieut.-Col.	(i) Until completion of 23 years' total service	1500	£30	13th and over
	(ii) During 24th and 25th years' total service	1600		
	(iii) After completion of 25 years' total service	1700		
	(iv) When selected for increased pay	1850		

Extras.—In addition to the above rates various allowances are admissible for a number of special appointments which may be held by members of the Indian Medical Service. Special high rates of pay are also attached to the numerous administrative appointments open to officers.

Candidates possessing certain higher medical qualifications may be granted an antedate of one year in their commissions. Past service in certain hospital appointments may also render candidates eligible for an antedate of one year. Persons holding or about to hold resident posts at recognized hospitals may be seconded in those posts for a period not exceeding one year. The maximum period of antedate, secondment, or antedate and secondment combined, is limited to one year.

Officers on appointment will receive an outfit allowance of £50.

With the exception of Administrative Officers, military or civil, and officers holding certain special appointments, officers are not debarred from taking private practice so long as it does not interfere with their proper duties.

The rates of pension are as follows.

	Per annum. £
After 17 years' service for pension	400
,, 18 ,, ,, ,, ...	420
,, 19 ,, ,, ,, ...	460
,, 20 ,, ,, ,, ...	500
,, 21 ,, ,, ,, ...	540
,, 22 ,, ,, ,, ...	580
,, 23 ,, ,, ,, ...	620
,, 24 ,, ,, ,, ...	660
,, 25 ,, ,, ,, ...	700
,, 26 ,, ,, ,, ...	750
,, 27 ,, ,, ,, ...	800

These rates are subject to alteration on account of a rise or fall in the cost of living as compared with the year 1914 to an extent not exceeding 20 per cent. in all. A reduction of 6 per cent. has been made this year on this account from the amounts shown.

There are additional pensions ranging from £65 to £350 per annum for officers who have held administrative appointments.

An officer on appointment is provided with a free passage to India. The wives and families of officers who are married prior to the date of the officers' embarkation on first appointment will also be provided with free passage to India, subject to the payment of messing charges.

Officers and their families are also eligible for passage concessions under which they are granted a certain number of return passages home at Government expense during their service.

Officers are required to undergo courses of instruction at the Royal Army Medical College, and at Aldershot, for approximately six months, prior to their embarkation for India on first appointment.

Further particulars may be obtained from the Under Secretary of State for India, Military Department, India Office, London, S.W.1.

PRISON MEDICAL SERVICE

Candidates for the prison medical staff are approved by the Secretary of State for the Home Office on the recommendation of the Prison Commissioners The Chairman of the Board is Mr A Maxwell, C B Application for employment may be made to the Board on a special form, which can be obtained from the Secretary, Prison Commission, Home Office, London, S W 1

In the smaller prisons the medical officer is usually a local practitioner, but in the larger the members of the medical staff are required to devote their whole time to the service In the case of those required to give their whole time to the service the appointment in the first instance is to the post of medical officer Class II, and from the seniors of this rank the medical officers Class I are selected as vacancies occur

Largely as a result of action taken by the British Medical Association some years ago, the salaries of prison medical officers were improved, and now are Medical officer Class II, £350, rising by annual increments of £20 to £600 , medical officer Class I, £650, rising by annual increments of £25 to £800 Unfurnished quarters are provided, or an allowance in lieu is made The civil service bonus is paid on the salary The Association has recently represented to the Royal Commission on the Civil Service, in connexion with a proposal to stabilize salary and bonus, that the remuneration of prison medical officers should be increased

There are 15 medical officers Class II, 12 medical officers Class I, and 23 part time medical officers The service is a small one, and therefore vacancies are comparatively rare and promotion is very slow

LOCAL GOVERNMENT (POOR LAW) MEDICAL SERVICES

A considerable change in administrative conditions in the Poor Law in England and Wales has been effected by the passing of the Local Government Act, 1929, which from April 1st, 1930, abolished the old boards of guardians, and transferred their functions to the county councils and county borough councils This should result in a higher degree of specialization in Poor Law work, particularly on the medical side, and a closer assimilation to other public health services

A number of whole time appointments exist under these new Poor Law authorities in Great Britain, certain of which, notably in the metropolis and the chief provincial cities, maintain large well equipped hospitals organized under purely medical administration Posts are available to medical practitioners as superintendents and assistant officers in hospitals and infirmaries, and as resident officers in other institutions, such as poorhouses, workhouses, etc Conditions and salaries show considerable variation , salaries for resident assistant medical officers in Poor Law infirmaries usually range from £200 to £450 a year, with full board, the duties being much the same as, but as a whole more responsible than, those of a house physician or house surgeon in a general hospital Medical superintendents are paid from £600 to £1,600 a year, with house, light, coal, laundry, etc , and in some cases the first assistant is termed deputy medical superintendent and receives £450 to £750 a year, with similar emoluments This service, therefore, offers openings for young practitioners and the prospect of a reasonable degree of progress for those who may choose to make it their career, with security of tenure, and provision for superannuation It should be added that the attractiveness or otherwise of any particular post has been, and still may be, in some degree affected by the policy adopted by the authority under whose jurisdiction it falls In the more advanced areas there is a high degree of differentiation in treatment between the sick and mentally affected, and the purely pauper class (between the hospital and the workhouse) , the tendency in such areas has been to develop the hospital services on lines approximating to those ruling in the voluntary hospitals In the majority of Poor Law institutions however, lay control through the administration by a workhouse master of the whole organization, has been preserved, and medical appointments in such circumstances are less attractive

In addition to the full time appointments of the character mentioned, the Local Government (Poor Law) Service offers numerous part time posts, such as those of district medical officer, parish medical officer, etc , which are practically all held by general practitioners Public vaccinators are also appointed under contract with the councils of the counties and county boroughs, except in London, where the municipal boroughs are responsible for the vaccination service

MEDICAL PRACTICE IN BRITISH DOMINIONS AND FOREIGN COUNTRIES

Medical Acts have now been passed in almost all places forming part of the British Empire beyond the seas, and registers of duly qualified practitioners are consequently maintained To these registers medical men educated in the United Kingdom are generally admissible merely on payment of a registration fee, providing they produce evidence that they are of good repute and are either registered or eligible for registration in the United Kingdom, as the local requirement may be The only exception to this statement that need be made relates to the Dominion of Canada Each of its provinces acts in medical matters as an independent State The result has been that reciprocity of practice has in the past been established between this country and all the provinces of Canada except British Columbia, where certain obstacles were never overcome It has, however, to be recorded that reciprocity with Saskatchewan, New Brunswick, Ontario, and Quebec has recently been brought to an end by those provinces We would advise any medical man proposing to practise in Canada first to communicate with the Provincial Registrar, stating what degrees or diplomas he holds, and asking for information as to the precise steps he must take in order to obtain admission to the Provincial Register The Licence of the Dominion Council, which can only be obtained after examination, entitles its holder to registration in any of the provinces of Canada, though in regard to Quebec there is a proviso that " he must have been registered in the province five years prior to the application for the recognition of the Dominion Licence " In order to sit for the examination for the Dominion Licence, it is necessary to obtain either a licence from one of the provinces (this can be obtained from one of those with whom reciprocity has been established), or a certificate from a Provincial Council that the requirements of that Council in regard to preliminary education, matriculation, medical curriculum, and graduation have been complied with

Italy and Japan are the only two foreign States with which complete medical reciprocity has been established, though there are other countries which grant a limited recognition to British qualifications Generally speaking, in Continental countries (with the exception of the kingdom of Italy) a British medical man desiring to exercise his profession therein must pass practically the same examinations as those imposed on natives of the country The same observation applies to all foreign States in the South American continent Each of the United States of North America has its own laws and regulations governing medical practice and all of them require the holder of a British qualification to submit to an examination A number of the States, including New York, Illinois, Michigan, and Indiana, require naturalization

A pamphlet showing the conditions under which medical and dental practitioners legally qualified in their own country may practise abroad can be obtained from the office of the General Medical Council, 44, Hallam Street, Portland Place, London, W 1, price 2s 6d , or 2s 9d post free in the United Kingdom Practitioners who think of going abroad to practise will find therein much useful information, including the name of the official in each country to whom requests for further particulars should be addressed A new edition was published in 1930

MEDICAL APPOINTMENTS IN THE COLONIES AND MANDATED TERRITORIES

Medical appointments in the self-governing Dominions and the territories under their control, and in Southern Rhodesia and Malta, are made by the Governments concerned, and are not in general open to candidates in the United Kingdom. In Ceylon, Mauritius, Jamaica, Barbados, the Bahamas, and Bermuda vacancies are practically always filled by the appointment of qualified local candidates or, in the case of some of the higher posts, by transfer from other colonies. Appointments to the medical services of the remaining colonies and other territories under the administrative direction of the Colonial Office are made by the Secretary of State for the Colonies in this country. Such appointments are to a given colony or group of colonies, for there is no unified service directly administered from the Colonial Office. It follows that conditions of service and superannuation are in the main determined by the economic resources and general public health policy of the individual colony and its local government, and vary almost as widely as do conditions of climate. Moreover, the extent of the control exercised by the Colonial Office varies according to the constitutional status of the particular colony, and the detailed information available centrally is not always complete. The intending candidate, therefore, should make comprehensive inquiries as to local conditions, and particularly as to facilities for private practice where this is included in the terms of appointment. He will also do well to supplement official information by reference to the Medical Secretary at the Central Office of the British Medical Association (Tavistock Square, London, W.C.1), where reports obtained from time to time from the local Branches are available. This is the more necessary because opportunities for transfer from the medical service of one colony to that of another are as yet rare, except in connexion with specialist and senior appointments.

To those physically and mentally suited to the climatic and social conditions peculiar to the various colonies the Colonial Medical Services should, and in some cases do, offer a field of professional activity rich in interest and in opportunity for pioneer work, with increasing facilities for specialization and research.

The prevailing trade depression and the consequent curtailment of revenue have inevitably affected the health programme among other activities of the Colonial Governments, but this check is in some degree offset by growing appreciation among the local administrations of the potentialities of sanitation and by quickened parliamentary and departmental interest in the development of a sound medical policy. It is significant in this connexion that the question of the best method of utilizing the funds available under the Colonial Development Act of 1929 for the promotion of medical research, and the application of its results to public health problems in the Colonial Empire, was deemed worthy of special interdepartmental inquiry. The assistance recommended by the Colonial Development Committee under the head of public health during the first eighteen months' operation of the fund amounts to £410,486. The recommendations of the committee on the system of appointment in the Colonial Office and the Colonial Services, published in May, 1930, mark an important step in the development of the Colonial Services in general, including the medical services. Acceptance by the Secretary of State for the Colonies and the Colonial Office Conference of the principle of unification has at last cleared the way for the elaboration of practical schemes for its application. Such unification would secure to members of the smaller medical services much-needed opportunities for promotion by transfer. Meanwhile, reorganization of the work of the promotions branch of the Colonial Office on the lines recommended by the committee should lead to welcome improvements in more than one direction.

Apart from immediate economic stringency, the outlook for the Colonial Medical Service is thus in the main a hopeful one, and especially so in the larger and better organized branches. This cannot yet be said of all the smaller services, some of which are still hampered by conditions which make full efficiency unattainable. The urgent necessity therefore remains for making careful and sufficient inquiry as to the position in any given service before accepting appointment.

The medical services recruited in this country by the Secretary of State for the Colonies include those of West Africa, East Africa, Malaya, Hong-Kong, the West Indies, Fiji and the Western Pacific territories, and Palestine, besides a number of smaller services offering individually one or two appointments at an inadequate remuneration and with no prospect of promotion. Of late years certain medical appointments in the service of the Government of Iraq have been filled with the concurrence and normally upon the recommendation of the Secretary of State; but political conditions make fresh vacancies unlikely at present.

In the Fiji Medical Service, although the basic salary of district medical officers (£500, by £25 to £725) is below the £600 minimum recommended as adequate by the British Medical Association, this fact is offset by the concession of allowances of from £175 to £275 in five of the districts, the value of private practice in the remaining seven being estimated at from £100 to £600 a year.

The services in the West Indies and some of the smaller colonies have not yet conceded the £600 minimum commencing salary, and whilst facilities for remunerative private practice, general conditions of service, and a relatively low cost of living must in some instances be taken into consideration, these compensations are by no means universal. The service in the Leeward Islands is in a condition which requires special notice by way of warning; but the position in Grenada has been considerably improved, and it is hoped that similar improvements will be effected shortly in other islands of the Windward group.

In general, candidates for these services must be between the ages of 23 and 35, although these limits are not for the moment absolute. Appointments are, subject to a varying period of probation, for the most part classed as permanent and pensionable, but there are some appointments by agreement for a specified limited term of service. There is no entrance examination, but practitioners selected for appointment must obtain a certificate of physical fitness from one of the consulting physicians to the Colonial Office. Post-graduate experience in hospital appointments is desirable, and in some cases special allowances are conceded to the holders of a D.P.H. Successful candidates are normally required to undergo an approved course of instruction in tropical medicine, the fees for their tuition being defrayed by the Government and an allowance being paid during their instruction.

At present some sixty medical women are employed in child welfare, maternity, and laboratory work, mainly in the larger services—for example, those in East and West Africa and Malaya. Salaries are the same as for men.

The bulk of the appointments made by the Secretary of State in this country are to the West African Medical Staff, the East African Medical Service, and the Medical Services in Malaya. These are the strongest individual services numerically, and therefore offer more frequent vacancies, better prospects of promotion, and better chances of specialist appointments than the smaller services.

West African Medical Staff

This is amongst the best organized and best paid of the Colonial Services. The territories covered by the service include Nigeria, the Gold Coast, Sierra Leone, and the Gambia. Climatic conditions vary considerably over this area, but they are in general admittedly trying. This fact is at present recognized by the provision of more frequent leave periods than are usual elsewhere.

The service includes medical, public health, and laboratory divisions, and specialist posts are almost invariably filled by promotion from the staff. The rate of pay for a medical officer is £660 on appointment, rising by annual increments to £960, together with a seniority allowance of £72 a year after reaching £720. There are a considerable number of specialist and administra-

tive posts carrying relatively high salaries, varying from £1,300, with duty allowance of £260, to £1,800, with duty allowance of £360 All appointments in the staff are pensionable Officers may retire voluntarily on reaching 50 years of age, and may be called upon to retire at 55 Pensions are calculated at the rate of 1/480th of the officer's pensionable emoluments (salary and house allowance) in respect of each complete month of service An officer of twenty five years service who has reached the maximum of the long scale receives a pension of approximately £790 per annum The pension may be converted into a reduced pension of three quarters of the full pension, with a gratuity of ten times the amount of the reduction Gratuities of £1,000 or £1,250 may be drawn on retirement after nine or twelve years' service Members of the West African Medical Staff are not usually permitted to take their wives or young children with them until they have acquired experience of the conditions of life and have obtained the sanction of the Governor In the case of young children this is only exceptionally given

African Medical Officers

Membership of the West African Medical Staff is limited to British subjects of European parentage but a number of Government appointments for African medical officers exist in the West African Colonies These appointments carry salary on the scale £500 £25 £600 and there is a higher scale £600 £30 £720 In addition in Nigeria and the Gold Coast arrangements have been made for the employment of a few young African medical men temporarily on the hospital staffs with a view to appointment to the Government service later if suitable In such cases a salary of £400 a year is paid

East African Medical Service

This service includes Kenya, Uganda, Tanganyika Territory, Nyasaland, Zanzibar, and British Somaliland In East Africa *there is a very wide scope for clinical work*, both medical and surgical, as well as for research and for preventive medicine and sanitation The service as a whole is fully alive to its responsibilities and opportunities, individual initiative is encouraged, and the career of a medical officer depends, not on seniority alone, but to a large extent on his own capability In all but a few stations conditions allow a medical officer's wife to accompany him, but this is not generally desirable on first appointment In some dependencies the consent of the Governor must be obtained The service includes a medical and a sanitary division The former is open to those holding ordinary medical and surgical qualifications, post graduate experience in a hospital appointment being an advantage, posts in the sanitary division will as far as possible be filled by those holding a Diploma in Public Health or a Diploma in Tropical Medicine and Hygiene Climatic conditions vary considerably In a considerable part of Kenya they approximate more to the temperate than the tropical zone; but there are some areas in the East African Dependencies where conditions more closely resemble those in West Africa The rate of pay for a medical officer is from £600 on appointment, rising by annual increments of £30 to £840, and thereafter, subject to an efficiency bar at this point, by £40 to £920 Holders of the D P H receive a special concession of two increments on appointment, or from the date of obtaining the diploma, thus reaching the maximum of the grade two years earlier than they would otherwise do Private practice may be permitted in certain circumstances, but there is no right to it even in stations where opportunities may exist

As in the case of the West African Medical Staff, a candidate can only apply for appointment to the East African Medical Service in general, and is liable to transfer between the several dependencies, but he may express his preference for any particular colony, and his wishes will, we are informed, be met as far as possible As a rule, transfer only takes place on promotion or at an officer's own request The gratuities available on retirement after nine or twelve years' service are similar to those for the West African Medical Staff Officers may elect or may be required to retire on pension on reaching the age of 50 years Pensions are calculated at the rate of 1/480th of emoluments (including value of free quarters) for each completed month of service The officer of twenty five years' service who has reached the maximum of the long scale receives a pension of approximately £650 per annum Pensions are convertible, under certain conditions, into a reduced pension and a gratuity

Medical Services in Malaya

These services cover the Straits Settlements, the Federated Malay States, the unfederated States, and the State of Brunei in Borneo The salary of 500 dollars a month, rising by 25 to 800 dollars, *plus* a temporary allowance of 5 per cent for single and 10 per cent for married officers, is generally considered adequate A non pensionable allowance of 100 dollars a month is paid to officers holding the D P H The officer of twenty five years' service who has reached the maximum of the long scale receives a pension of approximately £560 per annum Pensions are convertible, under certain conditions, into a reduced pension and a gratuity

The climate of Malaya is, for the Tropics, very healthy It varies little during the year The mean maximum and minimum temperatures are 86 8° and 74 3° F In some parts there are no marked rainy and dry seasons the rainfall being evenly distributed throughout the year In others there are a couple of dry months and a couple of exceptionally rainy months in the year The average rainfall is about 100 inches a year, and vegetation is always green People who lead regular, active lives have no difficulty in keeping in good health European children do well in Malaya up to the age of about 6 Numerous hill bungalows are available already for rest and change, and a large Malayan hill station has been constructed at a height of over 5,000 feet at Cameron's Plateau, on the Perak Pahang boundary

The professional duties of a medical officer may include medical, surgical, medico legal, and public health work His administrative work comprises hospital administration diets, returns and financial work, and includes the inspection of smaller hospitals and dispensaries Clerical work is reduced to the smallest possible amount An endeavour is made to consider an officer's own bent when posting him for duty Districts vary in size, and a certain amount of travelling will be necessary The white population in each district varies The district hospitals hold from 50 to 300 beds There is a staff of locally recruited medical men mostly trained at the Singapore College of Medicine Asiatic dressers and trained hospital assistants are employed in hospitals and dispensaries In addition to European sisters there is a large local nursing staff All hospital equipment is supplied by Government, including instruments At both the Institute for Medical Research in Kuala Lumpur, Federated Malay States, and the King Edward VII College of Medicine, Singapore, there are opportunities for research as well as for routine investigations Promising officers may be stationed at the Institute for short periods if they can be spared from other duties In addition to the full time professional posts at the College of Medicine, several of the medical staff in Singapore hold part time lectureships

It may fairly be said that the Malayan Medical Services now offer considerable scope for suitable candidates There are relatively to other services a large number of special appointments available in surgery, radiology, public health and pathology, and to those seeking a career in teaching the professorships at the College of Medicine Singapore, offer an additional attraction

Sudan Medical Service

This service is a department of the Sudan Government, and includes a number of Syrian medical officers and a number of assistant medical officers who are natives of the Sudan The British medical inspectors are from the outset senior to all other medical officers The service offers ample opportunities for specialization and for research, as well as for general medical and surgical work

The climate varies, but is not in general unfavourable, though hot In the northern desert the nights are cool, even in summer and the winter is pleasant and often cold In the central zone there is a rainy season of about four months, during which large areas become

malarious. The south is more tropical in character, and mosquito protected houses, nets, and protective quinine are essential during the greater part of the year, though even here the winter months are cool and pleasant. It is not considered desirable for medical inspectors to be accompanied by their wives until they have gained some knowledge of the language and the general conditions of life.

The commencing pay of a medical inspector is £E 720. On confirmation of appointment and success in the requisite examinations in Arabic the salary is increased by periodic increments to £E.1,200. Five senior administrative posts carry higher salaries. There is a compulsory contribution of 5 per cent. of pay towards pension, which, for a medical inspector, amounts, after twenty years' service, to £E.500 a year. An officer who is compulsorily retired before completing fifteen years' service is not entitled to pension, but receives a gratuity.

OFFICIAL SOURCES OF INFORMATION

All inquiries in connexion with medical appointments in the self-governing Dominions and their dependencies should be addressed to the High Commissioners or Agents-General for the Dominions. Intending applicants are also recommended to consult the Dominions Office and Colonial Office List, which may be seen at the Colonial Office Library or at the Library of the British Medical Association if not otherwise available, and the Professional Handbook, Part III (price 4d.), issued by the Oversea Settlement Department, Dominions Office, Caxton House, Tothill Street, London, S.W.1.

The position in Egypt is at present uncertain ; questions as to the possibility of any medical appointments becoming available under the Egyptian Government should be addressed to the Director-General, Public Health Department, Cairo.

Inquiries as to vacancies and conditions in the Sudan Medical Service should be addressed in the first instance to Dr. Hodson, 24, Welbeck Street, London, W.1.

All inquiries in connexion with Colonial medical appointments made by the Secretary of State for the Colonies, or such vacancies as may occur in Iraq or Palestine, should be addressed to the Director of Recruitment (Colonial Service), Colonial Office, 2, Richmond Terrace, Whitehall, London, S.W.1.

There remain a number of medical appointments made by mining companies and other commercial undertakings in various parts of the Tropics. Much caution should be exercised in accepting such posts, and the form of contract should be subjected to very careful scrutiny. Advice in this connexion should always be sought from the Medical Secretary of the British Medical Association, British Medical Association House, Tavistock Square, London, W.C.1.

DEGREES FOR PRACTITIONERS

At one time it was the almost universal custom for medical students educated in London and aiming at general practice not to seek a university degree, and as that custom still prevails to a considerable extent a large proportion of medical men in England possess diplomas or licences to practise but not degrees in medicine. This is a fact which there [illegible] and reason to regret, and to such practi-
of the Colonial Servic[illegible] paragraphs may be of interest. It
services. Acceptance [illegible]he M.D.Brux. diploma, if obtained
Colonies and the Coloni[illegible] registrable in this country, and
ciple of unification has at[illegible]ssels no longer holds special
elaboration of practical schem[illegible] unification would secure to medical practitioners. Moreover,
services much-needed opportuni[illegible]ham will hold no further
transfer. Meanwhile, reorganizatio[illegible]D. for practitioners of
promotions branch of the Colonial
recommended by the committee shoul[illegible]
improvements in more than one direction.

Apart from immediate economic stringen[illegible] University of
look for the Colonial Medical Service is thus [illegible]s than fifteen
a hopeful one, and especially so in the larger an[illegible]n practice
organized branches. This cannot yet be said of [illegible] below,

[*Note.*—It has been decided by Senate that examinati[illegible]
for this degree shall be discontinued after June, 1932.]

The candidate must be 40 years of age, and must pro[illegible]
a certificate of moral character from three registered m[illegible]
practitioners. Should he not have passed an examinat[illegible]
arts previous to the professional examination in virtu[illegible]
which his name was placed on the *Register*, he is exam[illegible]
in classics and mathematics, if otherwise, he is required
translate into English passages from any one of the follow[illegible]
Latin authors: Caesar, *De Bello Gallico* (first three book[illegible]
Virgil, *Aeneid* (first three books) ; or Celsus (first three book[illegible]
Natives of India or the British Colonies are placed on t[illegible]
same footing as natives of Great Britain, and must be
registered on the books of the General Medical Council of the
United Kingdom.

Professional Examination.—The candidate must pass an examination in the following subjects: (i) Principles and practice of medicine, including psychological medicine, hygiene and therapeutics ; (ii) principles and practice of surgery ; (iii) midwifery and diseases of women and children ; (iv) pathology, medical and surgical ; (v) anatomy, medical and surgical ; (vi) medical jurisprudence and toxicology. Candidates are examined by means of written papers, clinical and viva voce at the College of Medicine, Northumberland Road, Newcastle, and in the Royal Victoria Infirmary. The classical part of the examination may be taken separately from the professional on payment of a portion (£10 10s.) of the full fee.

The examinations are held twice a year, in June and December. Notice, accompanied by the fee and certificates, must be sent to the Secretary of Examinations, at the University of Durham College of Medicine, Newcastle-on-Tyne, at least twenty-eight days before the commencement of the examination.

Fees.—The inclusive fee for both professional and classical parts of the examination, together with the degree fee, is 50 guineas ; if a candidate fail to pass, 20 guineas are retained, but if he present himself again 40 guineas only are required.

University of Lausanne

M.D. Examination for Medical Practitioners

It has been possible for a long time to obtain the M.D. degree from one of the State Universities in Switzerland—namely, Bern, Geneva, and Lausanne. The regulations of the Faculty of Medicine of the University of Lausanne have recently been drastically revised by the authorities, and in October, 1930, new regulations came into force, of which a summary is given below. The main effect of these new regulations is to provide a special M.D. examination for medical practitioners from other countries.

Special Examination for Medical Practitioners holding a Diploma from Another Country

Article 34.—Holders of a foreign diploma which gives the right to practise medicine in their country of origin may be permitted to present a thesis for the doctorate in medicine. This thesis must be built up in one of the medical departments or clinics of the University of Lausanne, with the permission of the director of that department or clinic. If authorization is granted by the Faculty, to whom the candidate must make a written request for such, accompanied by a copy of the precise and detailed curriculum which he has followed elsewhere, and all the necessary proofs to support his application (diplomas, certificates of intermediate and preliminary examinations, student's record, etc.). He is actually handing in his thesis the candidate is obliged (*a*) to pursue in the Faculty of Medicine of Lausanne, in the status of a duly matriculated student, a course of study occupying two complete semestres (one academic year, October to July), and embracing the following subjects—pathology, clinical surgery, clinical medicine, public health and pharmacology, the course and laboratory work relating to the subject chosen for his thesis, and the courses on two other subjects at his choice ; (*b*) to undergo a special examination in each of the subjects mentioned above. When this examination has been passed the candidate is permitted to present his thesis which must be sent in to the Dean of the Faculty of Medicine.

The best time to take this special course is as soon after qualifying in this country as possible, when the book work is fresh in mind. The course is also suitable for I.M.S. and other Service men on a year's study leave. Further particulars may be obtained at any time from Dr. Charles A. H. Franklin, M.D., B.S., honorary secretary, Lausanne Medical Graduates, Greenbank, 154, Sandgate Road, Folkestone, Kent (booklet and copy of regulations, post free 2s. 1½d.).

SPECIAL DIPLOMAS

Information about the regulations for the various Diplomas in Tropical Medicine, in Psychological Medicine, and in Public Health is given in the appropriate sections of this Educational Number at pages 459, 460, 464 Further details in regard to the D P H and the D T M will be found in Sir Andrew Balfour's *Guide to the Regulations, Courses and Examinations for Qualifications in Public Health and Tropical Medicine* published by the British Medical Association, Tavistock Square, W C 1, at the price of 3s

It should perhaps be noted here that of the various diplomas in special subjects granted by licensing bodies only those in Public Health and Sanitary Science and State Medicine are at present admissible for entry in the official *Medical Register*, though other special diplomas may, of course, be included among the particulars of qualifications set out in the *Medical Directory*

As stated at page 430, a Diploma in Tuberculous Diseases is granted by the University of Wales to qualified medical practitioners new regulations for this diploma are now in force

DIPLOMAS IN MEDICAL RADIOLOGY

Diplomas in Medical Radiology are granted by the Universities of Cambridge, Edinburgh and Liverpool

The Cambridge Diploma —A Diploma in Medical Radiology and Electrology is granted by the University of Cambridge The primary object is to provide adequate training in a branch of medical work which is becoming increasingly important and difficult and which is outside the ordinary medical curriculum The diploma is open only to those who hold a medical qualification approved by the Diploma Committee The course occupies nine months The first three months (October to December), which may be spent either in Cambridge or in London are occupied with lectures and practical work in physics and electrotechnics, together with an introductory course in medical radiology and electrology The work for the second three months (January to March) can be done in London only, and comprises lectures and clinical instruction in radiology and electrology given by lecturers appointed by the Education Committee of the British Institute of Radiology, together with clinical experience in the radiological department of a hospital recognized for that purpose by the Diploma Committee During the last three months a candidate is required to hold a clinical clerkship or other similar appointment, in the radiological department of a recognized hospital Hospitals at a number of provincial centres as well as in London have been recognized by the Committee for this purpose In exceptional circumstances exemption from this regulation may be granted by the Committee The examination for Part I (physics and electrotechnics) is normally taken at the end of the first three months, and the examination for Part II at the end of six months At the conclusion of the nine months course a candidate who has passed both parts of the examination is required to present a thesis composed by himself This thesis must be approved by the Committee before the candidate is entitled to the Diploma The thesis is to be in the form of a critical report, with notes upon six cases, either in radiology or electrology or in both these subjects, and must illustrate various methods of diagnosis or treatment The course for 1931-32 begins on October 5th Examinations for Part I will begin on January 6th and April 13th, 1932, and for Part II on April 12th and July 13th, 1932 Further particulars of the courses and examinations can be obtained from the Secretary for the Diploma, G Stead, M A , Cavendish Laboratory, Cambridge, or from Dr A E Barclay, Radiological Department, Medical Schools, Cambridge, or from the General Secretary, British Institute of Radiology, 32 Welbeck Street London, W 1

The Edinburgh Diploma —Candidates for the diploma must be graduates in medicine and surgery of the University of Edinburgh, or hold corresponding registrable degrees or qualification from some other licensing body Candidates are not admitted to the examination for the diploma until after the lapse of not less than one year from obtaining a registrable qualification, which qualification must be registered before admission to the examination The course of study begins in October and extends over a period of not less than three terms The examination, which is written, oral, and practical, is in two parts (*a*) physics, and (*b*) radiology The examination is held twice yearly—namely, July and October Full particulars may be obtained from the Dean of the Faculty of Medicine In this connexion it may be noted that radiology can now be taken as the special subject in the examination for Membership of the Royal College of Physicians of Edinburgh Several candidates have already taken radiology as their special subject, it means that an honours standard has to be attained

The Liverpool Diploma —The University of Liverpool grants a Diploma in Medical Radiology and Electrology Candidates before admission to the examination for the diploma must possess a registrable qualification approved by the university in medicine and surgery, and must have attended courses of instruction in (*a*) physics (two terms) , (*b*) (i) radiology and (ii) electrology, during the six months in the x-ray and electro-therapeutic departments of a hospital or hospitals An examination is held in March each year, the subjects being (*a*) physics, (*b*) radiology and electrology Examination in either part may be taken separately Fees tuition £24 5s , examination and diploma £6 5s A registration deposit fee of £5 5s is charged on application and credited to the fees, but is not returnable in the event of the candidate failing to register These courses commence during the first week in October Application should be made to the Dean, Faculty of Medicine, the University of Liverpool

DIPLOMA IN LARYNGOLOGY AND OTOLOGY

The Conjoint Examining Board in England (Examination Hall *Queen* Square, London, W C 1) grants a Diploma in Laryngology and Otology (D L O) after an examination held in June and December The examination comprises two parts Part I on the anatomy, embryology and physiology of the ear nose pharynx, larynx, trachea and bronchi and oesophagus Part II, on the recognition and use of special instruments and appliances, and the medicine surgery and pathology of these regions Candidates may enter for Part I at any time after a registrable qualification in medicine, surgery, and midwifery has been obtained Candidates may enter for Part II on completion of one year of special study of diseases of the ear, nose, pharynx, and larynx, after a registrable qualification has been obtained, provided that Part I has been previously passed, and on production of certain certificates The conditions of study may be modified at the discretion of the Committee of Management in special cases The fee for admission or re-admission to each part is six guineas

DIPLOMAS IN OPHTHALMIC MEDICINE

A special Diploma in Ophthalmic Medicine and Surgery is granted by the University of Oxford and by the Conjoint Examining Board in England

University of Oxford —For the Diploma in Ophthalmology (D O) attendance on a twelve months course of clinical ophthalmology in hospitals or institutions recognized for the purpose by the Board of the Faculty of Medicine, and on a course of instruction in Oxford lasting two months, is obligatory Candidates must have their names on the *Medical Register* of the United Kingdom unless, being Bachelors or Doctors of Medicine of universities outside the United Kingdom they have obtained special permission from the Board of the Faculty of Medicine

The Conjoint Board —The Diploma in Ophthalmic Medicine and Surgery of the Conjoint Examining Board of the Royal College of Physicians of London and Royal College of Surgeons of England is issued after completion of an examination held in two parts—in January and July

The examination in each case is partly written, partly oral, partly clinical or practical. Part I comprises anatomy and embryology of the visual apparatus, physiology of vision, elementary optics; Part II comprises optical defects of the eye, ophthalmic medicine and surgery, pathology with special reference to medical and surgical ophthalmology. Candidates may enter for Part I at any time after a registrable qualification in medicine, surgery, and midwifery has been obtained. Candidates may enter for Part II on completion of one year of special study of ophthalmology after a registrable qualification has been obtained, provided that Part I has been previously passed, and on production of certain certificates. The conditions of study may be modified at the discretion of the Committee of Management in special cases. The fee for admission or readmission to each part is six guineas.

Diplomas in Obstetrics

The Society of Apothecaries of London, as stated on page 431, has now instituted a Mastery of Midwifery, and issues a diploma under this title denoting the possession of specialized knowledge of ante-natal care, midwifery, and child welfare. The diploma is, however, not registrable under the Medical Acts.

The Conjoint Examining Board in England, according to the new regulations for its Diploma in Gynaecology and Obstetrics (D.G.O., R.C.P. and S.Eng.), will hold examinations on October 29th, 1931, and in April, 1932. Those eligible for admission to examination must have held a degree in medicine and surgery recognized by the Board, or a qualification registrable in this country, for not less than three years. The subjects of the examination are gynaecology and obstetrics (including pathology, histology, and bacteriology in relation to these subjects), and ante-natal, post-natal, and infant welfare work. The examination is written, oral, and clinical, but only those candidates are admitted to the clinical who satisfy the examiners in the written and oral. A form is issued on which particulars have to be given and certified as to resident appointments in the gynaecological and obstetrical department of a recognized general hospital, in a gynaecological hospital, or a maternity hospital, or as to registrarship or clinical assistantship held in such institutions, together with particulars as to regular attendance, with responsible care of patients, at recognized ante-natal, post-natal, and infant welfare clinics during twelve months. It is added that these conditions of study may be modified in the case of a candidate who has carried out original investigations or written a thesis on some subject in gynaecology or obstetrics, or whose studies have extended over a prolonged time without fulfilling the exact conditions set out; but exemption will not be granted from any part of the examination. The fee for admission to examination or re-examination is ten guineas. Copies of the regulations for this diploma may be obtained from the Secretary, Examination Hall, Queen Square, W.C.1.

The British College of Obstetricians and Gynaecologists was founded and incorporated in September, 1929. The objects of the College are set forth in the memorandum of association. The first, a very important object, is "to encourage the study and practice of obstetrics and gynaecology, subjects which should be inseparably interwoven." The College consists of Fellows and Members, and has power to take part in the examination of candidates for admission to the British register of medical practitioners, in co-operation with teaching and/or examining bodies authorized to conduct medical examinations for the purpose of qualifying candidates for admission to the British register of medical practitioners, if invited by such bodies. It also has power to grant diplomas and certificates in obstetrics and gynaecology, either alone or in co-operation with teaching and/or examining bodies authorized to grant such diplomas. Candidates for the Membership of the College have to show evidence of having held resident appointments in general medicine or surgery, and also in obstetrics and gynaecology, before entering for the examination. The Fellowship of the College is granted to those Members who are judged by the College to have advanced the science and art of obstetrics and gynaecology. The Fellowship and Membership of the College includes practically every teacher of obstetrics and gynaecology in Great Britain, and many distinguished exponents in the British Dominions. It is hoped that in a few years' time one of the essential qualifications for election to the staff of all departments of obstetrics and gynaecology in general and in special hospitals will be the Fellowship or Membership of the College. Consequently, all intending to specialize in these subjects should endeavour to obtain as soon as possible the Membership, the conditions and regulations of which may be obtained from the honorary secretary. The president is Professor W. Blair Bell, the treasurer Mr. Eardley L. Holland, and the honorary secretary Professor W. Fletcher Shaw (20, St. John Street, Manchester).

MEDICAL MISSIONARIES

Missionary societies are in constant need of qualified men and women to fill vacancies as they occur in their hospitals, and also to enable them to take advantage of fresh openings. To those suitably endowed the mission field offers unique opportunities for interesting work, and the development of native medical schools, as training institutions in connexion with some of the larger mission hospitals, affords excellent scope for valuable work to medical men and women who are qualified to teach. It is not usually expected that medical missionaries should take a position such as would otherwise be occupied by an ordained clergyman or minister, but it is essential that they should be prepared to exert their influence in any hospital to which they may be sent so that a Christian atmosphere may be maintained and the work of evangelization be carried on through the ministry of healing.

As for scientific and other qualifications for the work, medical missionaries, in addition to being physically capable of sustaining a life which makes a great demand upon their strength, should be thoroughly well-trained physicians and surgeons. It is very desirable that they should have held a resident appointment at a general hospital, and have a good knowledge of practical surgery, gynaecology, tropical medicine, and the treatment of eye diseases. Useful information can be obtained from the secretaries of the various Missionary Societies, or from Thomas B. Adam, Honorary Secretary, Medical Advisory Board on Medical Missions to the Conference of Missionary Societies in Great Britain and Ireland, The Crossways, 45, Kenton Road, Harrow, Middlesex, or 19, Furnival Street, E.C.4.

Dental Surgery

Until the passing of the Dentists Act, 1921, the profession of dentistry in this country was regulated by enactments corresponding very closely with those relating to the practice of medicine—that is to say, there was no direct prohibition of the act of practice; and the Dentists Act of 1878 gave the same degree of protection to legally qualified and registered dentists as was accorded to registered medical practitioners—namely, the reservation of the use of certain titles. This Act provided also (1) that no person should take or use the name or title of "dentist" (either alone or in combination with any other word or words) or of "dental practitioner," or any other name, title, or description expressed in words or by letters implying that he was specially qualified to practise dentistry, unless he was registered, under a penalty of £20, and (2) that an unregistered person could not recover any fee or charge in respect of any dental operation, attendance, or advice. But, in the case of the practice of medicine by unqualified and unregistered persons, certain deterrent factors came into play—such as the inability to give a death certificate—and these did not operate to the same extent in the case of dentistry; hence, unqualified practice was far more prevalent in dentistry than

medicine, and increased after a decision of the House of Lords placing a narrow interpretation upon the words "specially qualified to practise dentistry," by defining the word "qualified" as not referring to competence but to the possession of a recognized diploma.

DENTISTS ACT, 1921

This unsatisfactory position was remedied by the passing into law of the Dentists Act, 1921; its provisions are based largely on the recommendations of a departmental committee appointed in 1917 by the Privy Council "to investigate the extent and gravity of the evils connected with the practice of dentistry and dental surgery by persons not qualified under the Dentists Act." Since November 30th, 1922, no person has been permitted by law to practise or hold himself out, whether directly or by implication, as practising or as being prepared to practise dentistry unless he is on the *Dentists Register* provided for by the Dentists Act, 1878. The practice of dentistry is defined as including "the performance of any such operation and the giving of any such treatment, advice, or attendance, as is usually performed or given by dentists," and the performing of any operation or the giving of any "treatment, advice, or attendance on or to any person as preparatory to or for the purpose of or in connexion with the fitting, insertion, or fixing of artificial teeth." The maximum penalty incurred by an unregistered practitioner is £100 for each offence. There are, however, certain important exceptions to the requirement of registration. A registered medical practitioner may practise dentistry without being on the *Dentists Register*, though he may not give dental treatment to insured persons under the National Health Insurance Acts unless he be so registered, and a registered pharmaceutical chemist or chemist and druggist may extract a tooth where the case is urgent and where no doctor or dentist is available, but the operation must be performed without any kind of anaesthetic; further, any person may carry out minor dental work in a public dental service under the personal supervision of a registered dentist provided it is in accordance with conditions approved by the Minister of Health after consultation with the Dental Board.

Dentistry may be carried on by a corporate body provided the majority of the directors and all the operating staff are registered dentists, and that no business other than dentistry or only some business ancillary to dentistry is carried on by the company. Companies carrying on the business of dentistry at the present time are permitted to continue to do so with certain restrictions, provided that the name of the company as well as the names of the directors have been entered in a list kept by the Registrar for that purpose. Every director or manager of a company convicted of an offence under the Act will be held to be guilty of the offence unless he proves that the offence was committed without his knowledge, and the court may, in addition to a fine, order that the name of any director convicted shall be removed from the list of directors aforesaid.

THE DENTAL BOARD

On the establishment of the Dental Board in 1921 certain powers and duties of the General Medical Council were transferred to it, including the duty of erasing from the *Dentists Register* any entry which has been incorrectly or fraudulently made. An inquiry into the case of a person alleged to be liable to have his name erased from the *Register* is made by the Board, which reports its findings to the General Medical Council, the order directing the erasure being made by the Council. A name erased from the *Register* can only be restored by the Council upon a report made by the Board. An appeal to the High Court may be made by any person aggrieved either by refusal of the Board to register his name or by the removal of his name from the *Register*. The administrative expenses of the Board are defrayed from the registration fees and annual retention fees, but any surplus may be allocated to purposes connected with dental education and research or to any public purpose connected with dentistry. The office of the Dental Board is at 44, Hallam Street, London, W.1.

DENTAL EDUCATION AND EXAMINATION

The preliminary examination in arts is the same for medical and dental students, and the early stages of their education embrace much the same subjects[1]; and, as the dental student is required to obtain a knowledge of the broad principles of medicine and surgery, it is necessary for him to pursue some portion of his studies at a medical school as well as at a special dental school, the latter not undertaking the teaching of these subjects. Registration as a dental student is not in all cases compulsory, though it is to be advised as convenient as affording proof of the commencement of professional education, and it is required by most of the licensing bodies, all of whom insist upon a curriculum covering four academic years.

Degrees and diplomas in dentistry are granted by the Universities of Belfast, Birmingham, Bristol, Dublin, Durham, Leeds, Liverpool, London, Manchester, St. Andrews, Sheffield, and the National University of Ireland, as will be found stated in the articles on these universities. Licences in dentistry entitling the holder to be registered on the *Dentists Register* are granted by the Royal Colleges of Surgeons of England, of Edinburgh, and in Ireland, and by the Royal Faculty of Physicians and Surgeons of Glasgow.

Recognized dental schools are numerous. In London there are those connected with the Royal Dental Hospital, Leicester Square; the National Dental Hospital (now the University College Hospital Dental School), Great Portland Street; Guy's Hospital; King's College Hospital; and the London Hospital. In the provinces there are the Birmingham Dental Hospital; the Royal Infirmary and the General Hospital, Bristol; the Dental Hospital and the Public Dispensary, Leeds; the Dental Hospital, Liverpool; the Dental Hospital, Manchester; the Dental Hospital and School, Newcastle-on-Tyne; the Royal Hospital, Sheffield. In Scotland there are the Dental Hospital, Dundee; the Incorporated Dental Hospital and School, Edinburgh; and the Incorporated Dental Hospital, Glasgow; and in Ireland, the Belfast Dental School, the Incorporated Dental Hospital of Ireland, Dublin, and the Royal College of Surgeons in Ireland, Dublin.

All who think of becoming dentists may be advised to study a Memorandum, lately drawn up for their guidance by the Registrar of the Dental Board, setting out in convenient form and in untechnical language information for which request is frequently made to the Board.[2] It will be seen from this pamphlet that in order to assist suitable students the Dental Board has instituted a system of bursaries to pay the fees of those who have not the financial means to qualify, and in exceptional cases maintenance may also be given as well.

Recommendations of the General Medical Council

The Dentists Act still leaves to the General Medical Council the duty of controlling the course of study and examinations required for dental qualifications.

The following recommendations as to the course of study and examinations to be required of candidates for degrees or licences in dentistry or dental surgery were adopted by the Council in 1922.

Preliminary Examination and Registration

1. That every dental student shall, at the commencement of his studentship, be registered in the manner and under the conditions prescribed for medical students.

2. That before registration in the *Dental Students Register* every applicant shall be required to have passed, in addition to the examination in general education, which shall be the same as that required for medical students, an examination in Elementary Physics and Elementary Chemistry, conducted or recognized by one of the licensing bodies, which shall also be the same as that required for medical students.

3. That before registration as a dental student every applicant shall produce evidence that he has attained the age of 17 years.

[1] See the Registrar's Memorandum on Students' Registration printed in the article on the General Medical Council at page 421.

[2] *Memorandum by the Registrar on the Procedure to be Adopted by Those who Desire to Enter the Profession of Dentistry, with Notes on Costs and Prospects.* 1929. Dental Board of the United Kingdom, 44, Hallam Street, W.1. Price 1s. post free.

Professional Study

4 That every candidate for a degree or licence in dentistry or dental surgery shall be required before admission to the final or qualifying examination to produce certificates showing:

(i) That he is at least 21 years of age.

(ii) That he has been registered as a dental student.

(iii) That he has, subsequently to the date of registration as a dental student, been engaged in professional study for at least four years, of which three years at least shall be spent at a school or schools recognized for professional study by one of the

(iv) to the date of registration as a dental student, he has attended at a recognized medical school courses of instruction which shall be the same as those required for medical students, in the following subjects: (*a*) Chemistry, and (*b*) Physics, in their application to medicine; (*c*) Elementary Biology That he has attended at a recognized medical school courses of instruction in the following subjects: (*d*) Human Anatomy (with dissections and demonstrations) for three academic terms, (*e*) Physiology (with laboratory instruction, including Practical Histology) for two academic terms, (*f*) General Pathology (including Bacteriology) for two academic terms, (*g*) Medicine for two academic terms; (*h*) Surgery for two academic terms, (*i*) the practice of a recognized general hospital or hospitals of not less than eighty beds, with certified instruction in Clinical Medicine and Clinical Surgery, for four academic terms

(v) That he has attended at a recognized dental school courses of instruction in the following special subjects. (*a*) Dental Anatomy and Physiology, human and comparative The course should comprise a minimum of twenty meetings of the class (*b*) Practical Dental Histology and Morbid Histology The course should comprise a minimum of sixteen meetings of the class (*c*) Dental Pathology and Surgery The course should comprise a minimum of twenty meetings of the class (*d*) Dental Materia Medica and Therapeutics The course should comprise a minimum of sixteen meetings of the class (*e*) Dental Metallurgy (with practical work and demonstrations) The course should comprise a minimum of twenty meetings of the class (*f*) Dental Mechanics (with practical work and demonstrations) The course should comprise a minimum of twenty meetings and twenty demonstrations (*g*) A course of instruction in the use of Anaesthetics, general and local, employed in dental practice, (*h*) A course of instruction in Radiology as applied to dentistry.

(vi) That he has for at least twenty-four calendar months attended, during the ordinary academic terms, the practice of a recognized dental hospital or of the recognized dental department of a general hospital

(vii) That he has received for not less than twenty-four calendar months, or for 2,000 hours, practical instruction in dental mechanics

Professional Examinations

5 That the examination for a degree or licence in dentistry or dental surgery shall be partly written, partly oral, and partly practical, and shall include the following subjects (*a*) Chemistry Physics and Biology, in their bearing on Medicine and Dentistry (*b*) Human Anatomy and Physiology (*c*) General Pathology, including Bacteriology (*d*) Medicine and Surgery (*e*) Dental Anatomy and Physiology, Dental Pathology Dental Surgery (including Orthodontics), Dental Materia Medica and Therapeutics and Dental Mechanics and Dental Metallurgy (*f*) Practical Examination in Dental Surgery (*g*) Practical Examination in Dental Mechanics and Metallurgy (*h*) Anæsthetics, general and local, employed in dental practice

6 That the prescribed subjects of examination may be combined or distributed at the discretion of the licensing bodies, and may be taken at two or more successive stages during the course of professional study, provided that no candidate shall be admitted to any final examination in dental surgery and dental mechanics until he shall have completed the required four years' course of study

ACKNOWLEDGEMENT

The detailed information published in this Educational Number of the *British Medical Journal* for the benefit of intending students of medicine and newly qualified practitioners has been revised throughout with the co-operation of the deans and secretaries of the medical schools and kindred institutions and of officials in the several public services, to all of whom we wish to acknowledge our indebtedness.

ENCEPHALITIS FOLLOWING VACCINATION AND CERTAIN INFECTIONS

A REQUEST FROM THE MINISTRY OF HEALTH

The Ministry of Health desires to invite the assistance of all members of the medical profession who are in active practice in this country in order to enable the Ministry to maintain full investigation of the characteristics of acute disease of the central nervous system (such as meningitis of any kind or origin, encephalitis, or polio encephalitis) which has been "post-vaccinal," using this term in the sense that the first symptoms have occurred within four weeks of vaccination. It will be remembered that a similar request was made in 1926 with the object of enabling the Department to place all the information so obtained before a committee which had then been appointed jointly by the Ministry and the Medical Research Council to consider vaccination questions The work of this committee terminated with the publication of its two reports of July, 1928, and January, 1931, respectively It was greatly facilitated by the information which was supplied from many quarters in response to this request, and, as there is still need for further particular study of these rare cases, it is now repeated. Similar information is desired of the occurrence of cases of acute disease of the nervous system which follow in the wake of acute infections such as measles, German measles, chicken-pox, whooping-cough, or influenza. It will be remembered that the Committee on Vaccination found that these sequels of infective processes, when of fatal issue, presented pathologically a very close resemblance to cases of post-vaccinal encephalitis, and gave reasons for the continued study and comparison of all these cases as a group. Intimations of the kind requested, if received in time, will permit of local inquiry to ascertain clinical details which may not subsequently be obtainable, and will also in some cases enable the Department to arrange for expert post-mortem examination and pathological examination of specimens. The request which is, therefore, made to all practising members of the medical profession is that when called in to any case of disease of the central nervous system with an acute onset, they will be so good as to inform the Ministry as soon as possible of every case in which they have ascertained that vaccination has preceded the onset of the symptoms within a period of four weeks, or in which the symptoms have immediately followed an acute infectious illness. The intimation should be sent as speedily as possible to the Senior Medical Officer, Med. I., Ministry of Health Whitehall, London, S.W.1. In view of inquiries which have been made as to the possibility of using a specific remedial treatment in cases of post-vaccinal encephalitis, it may be added here that the Lister Institute has prepared an anti-vaccinal horse serum, doses of which can be supplied, if desired, on application to the Ministry, while attention may also be called to the reference in the report of the Committee on Vaccination to the success which has been obtained in certain cases on the Continent by the treatment of this condition by intravenous injection of serum derived from persons who have been recently vaccinated.

A further instalment of the *Collected Papers* of the Walter and Eliza Hall Institute of Research in Pathology and Medicine, Melbourne, has now been published in a single volume, covering the years 1929-30 These papers are reprints from various medical journals in Australia and Great Britain, and deal with such topics as snake venoms, the bacteriophage, malignant diseases of different kinds, and the activity of stored anti-poliomyelitic serum in experimental poliomyelitis.

VACANCIES

BEDFORD COUNTY HOSPITAL.—V H S (male).
PETHNAL GREEN BOROUGH COUNCIL.—A M O
BIRMINGHAM CITY EDUCATION COMMITTEE.—Special Schools M O and Director of Child Guidance Clinic (male)

BIRTHS, MARRIAGES, AND DEATHS

The charge for inserting announcement of Births, Marriages, and Deaths is 9s. which sum should be forwarded with the notice not later than the first post on Tuesday morning, in order to ensure insertion in the current issue.

BIRTH

NIXON.—On August 30th, at 7, Lansdown Place, Clifton, Bristol, to Doreen, wife of Dr. J. A. Nixon, a son.

MARRIAGES

GRANT—GAMBLE.—On August 8th, at the Chapel of the Warwick County Mental Hospital, Hatton, Arthur Stanley Grant to Florence Margaret Gamble, M.D. Lond., M.R.C.P.

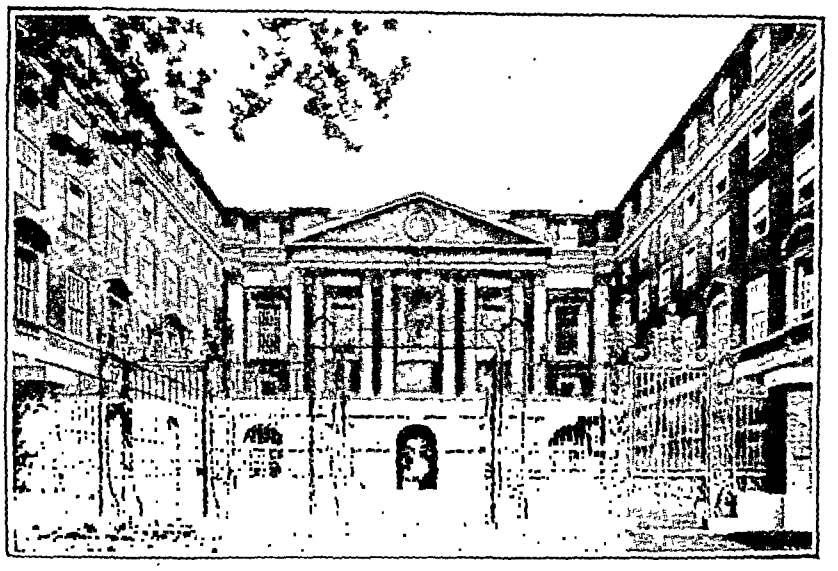
KERR—KEAY.—On September 1st, at St. George's Presbyterian Church, Southport, Dr. James R. Kerr, C.B.E., to Helen Dorrington, daughter of Mr. and Mrs. A. D. Keay.

RONALD—DRIVER.—At Bolton Abbey Church, on August 27th, by the Rev. C. F. Tomlinson, rector, Archibald Ronald, M.D., F.R.C.S.Ed., Barrow-in-Furness, elder son of Mr. and Mrs. J. K. Ronald, Milnathort, to Florence Elizabeth Driver, M.A., younger daughter of Mr. and Mrs. C. Driver, Nab View, Silsden.

DEATHS

NARAYAN.—On July 2nd, 1931, at 22 Mahendra Mansions, 61A Watson's Hotel), Bombay, Khansedhan, wife of the *late* Lt.-Col. K. S. Narayan, I.M.S., and mother of Major J. K. Narayan, I.M.S. (ret.).

SELBY.—At the Private Clinic, 25 Drumsheugh Gardens, Edinburgh, on August 23rd, 1931, J. J. Selby, M.B., M.B.E.



WILSON.—On August 22nd, 1931, in the Westcliff Nursing Home, Horace R. Wilson, M.D., D.P.H., late Medical Officer of Health for Southwark, London.

[The present issue being the Annual Educational Number much current material is held over, and neither the "Supplement" nor the "Epitome of Current Medical Literature" is published this week.]

The British Medical Association:

ITS AIMS, WORK, AND CONSTITUTION

The British Medical Association, as stated in our introductory article on the Profession of Medicine, was founded in 1832 to promote the medical and allied sciences, to maintain the honour and interests of the profession, and to foster a feeling of friendship among its members. To attain these objects it holds periodical meetings for the discussion both of medical and scientific subjects and of professional affairs; it publishes the *British Medical Journal*; it maintains a reference and lending library; it has instituted lectures, and scholarships and grants for research. It thus concerns itself with every side of medical work—science, clinical medicine, public health, and the material interests of professional life. The British Medical Association, with a membership now exceeding 35,000, is the oldest, largest, and most powerful British organization devoted to the welfare of the medical profession. It has a fine building in Tavistock Square, London, for its headquarters. These premises, designed by Sir Edwin Lutyens, R.A., were formally opened in 1925 by His Majesty the King, Patron of the Association; and the beautiful wrought-iron gates erected as a memorial to the 574 members who fell in the war, by which the main quadrangle is completed, were dedicated on that occasion by the Archbishop of Canterbury. The need for larger accommodation had become insistent owing to the remarkable growth in the central work of the Association during recent years, which had far outstripped the capacity of the premises in the Strand. Further extensions to the building in Tavistock Square have now been completed.

British Medical Association House: Court of Honour

Constitution and Administration

The Association has Branches and Divisions throughout Great Britain and Ireland, and also in the Dominions, Colonies, and Dependencies. The Divisions are arranged territorially, and number, in all, 250. For certain purposes of administration or of scientific and clinical work, the Divisions are combined into 100 Branches. Members of Divisions elect representatives on the Branch Councils and also a member or members of the Representative Body, which is the governing body of the Association and determines its policy.

The Council is the executive of the Association. It is elected partly by the Divisions and Branches and partly by the Representative Body, and includes representatives of the Navy, Air Force, Army, and Indian Medical Services elected by the Representative Body. The Representative Body and Council elect standing committees to take charge of different subjects. Among these may be mentioned the Science, Medico-Political, Ethical, Hospitals, Public Health, and Naval and Military Committees. There are Committees also for the Dominions, Scotland, Ireland, and Wales; and for the working machinery of the Association, such as the Organization, Finance, and Journal Committees. The Insurance Acts Committee, elected partly by the Association and partly by insurance medical practitioners, is financed by the Association; it is the recognized executive and mouthpiece of the insurance practitioners of Great Britain.

Privileges of Members

A member of the Association has the right—

1. To attend the annual and other general meetings of the Association and the meetings of the Division and Branch to which he or she belongs.
2. To take part by personal vote (or in some Divisions by voting paper) in the election of the representative of his or her Division in the Representative Body, and also in the election of members of the Council.
3. To receive by post the *British Medical Journal*, published weekly, which gives a full record, with commentary, of progress in clinical and scientific medicine and of medico-political affairs throughout the British Empire.
4. To receive the help and advice of the central office in any professional difficulty.
5. To use the Library as a reading room, and to borrow current medical or scientific books on payment of postage. Besides modern works and periodical medical literature—foreign as well as English—the library contains many books of historic interest.

The full benefits of the Association can only be secured by the co-operation of large numbers of the medical profession, for the greater the membership and the funds the more efficient and influential the organization. The Association during the past ninety-nine years has been the direct means of benefiting every class of medical men and medical women. In asking for new members it looks not only to the older practitioners but also and especially to those recently qualified. To these a generous concession is made as regards subscription, and there is a special claim to their recognition of the work of the Association in improving the conditions under which they may hold appointments in the public services or in civil life. The Association's work for the Services is well known. It feels a special responsibility towards those members of the profession who by reason of their position are precluded from taking common action.

Subscriptions and Applications for Membership

The ordinary subscription to the British Medical Association is 3 guineas a year for members resident in the British Isles, but this is subject to various exceptions. Thus, newly qualified practitioners elected within two years of registration pay half this sum up to the end of the fourth year after registration; medical officers on the active list of the R.N., R.A.F., R.A.M.C. (*Regular*), and I.M.S. pay 2 guineas; concessions are made also to members (in the British Isles) of forty years' standing, to members of ten years' standing who have retired from practice, to medical married couples residing together, and to whole-time teachers and research workers. The ordinary subscription for members living abroad is 1½ guineas, but Branches have special local subscriptions. A member elected after June 30th pays half the subscription for the year.

All duly qualified British medical practitioners are eligible for election. Full particulars can be obtained from the Medical Secretary, B.M.A. House, Tavistock Square, London, W.C.1; the Scottish Medical Secretary, 7, Drumsheugh Gardens, Edinburgh; or the Irish Medical Secretary, 16, South Frederick Street, Dublin.

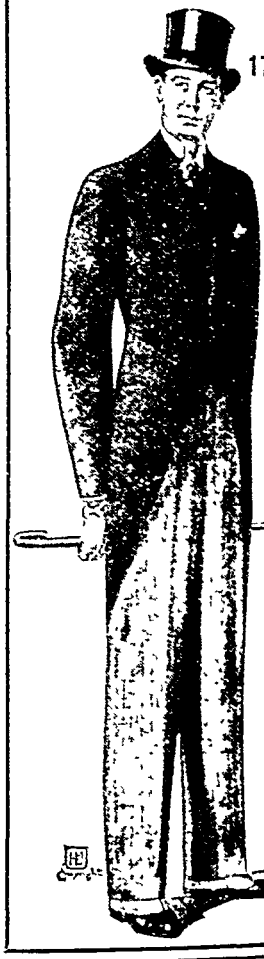
Accurate Arterial Pressure Readings

For visiting purposes the TYCOS Portable Sphygmomanometer amply fulfils the Physician's needs. Although one of the most delicate and accurate instruments of the medical man's equipment, the portable type as illustrated can be carried without fear of breakage. There is no glass tubing to break, no mercury to spill, and the readings can be verified at a glance by comparing the relation of the hand to the immovable zero.



Care should be taken to avoid close imitations. Look for the trade mark "TYCOS" engraved on the dial of every genuine instrument.

Obtainable from all reputable Instrument Dealers.

FOR DEAFNESS
Doctors prefer "ARDENTE" because—

"ARDENTE" STETHOSCOPE.
Mr. R. H. Dent makes a Stethoscope specially for members of the medical profession suffering from deafness. Many are in use, and excellent results are reported on the latest, as evidenced by the interest shown at the last B.M.A. Meeting

1. It is individually fitted to suit the case for young, middle-aged, or old.
2. It is simple and true-to-tone, and leaves the hands free.
3. It removes strain, thus relieving head noises, giving inconspicuous hearing.
4. It conveys sounds from varying ranges and angles.
5. It is entirely different, uncopyable, and carries a guarantee and service system.
6. It is suitable for "hard of hearing" or acutely deaf through various causes.
7. It is helpful for conversation, music, talkies, wireless, home, office, public work, and sports.

FREE HOME TESTS
arranged for Doctors and Patients.
Medical Prescriptions made up to the minutest detail.

MEDICAL REPORTS
Commended by the leading medical journals.—Mr. Dent will be happy to send full particulars and testimonials on request.

Is it fair to your best friend to make him your Executor? The duties are onerous, and usually thankless; the responsibilities are great and the penalties for neglect are severe. Moreover, he may die, and the expense of appointing his successor is considerable. On the other hand, if you appoint the Westminster Bank instead, the fees (which are paid out *of your estate*) *will probably be only a fraction of the legacy* which you would have left to a private trustee.

Ask for the 'Executor and Trustee' booklet at any local branch, or call at

ST. ANDREW'S HOSPITAL

FOR MENTAL DISORDERS.

NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY.

President: THE MOST HON. THE MARQUESS OF EXETER, C.M.G., A.D.C.

Medical Superintendent: DANIEL F. RAMBAUT, M.A., M.D.

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients, who are suffering from incipient mental disorders or who wish to prevent recurrent attacks of mental trouble; temporary patients; and certified patients of both sexes, are received for treatment. Careful clinical, biochemical, bacteriological, and pathological examinations. Private rooms, with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE.

This is a Reception Hospital in detached grounds, with a separate entrance, to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods, including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical bath, Plombières treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray Room, an Ultra-violet Apparatus, and a Department for Diathermy and High Frequency treatment It also contains Laboratories for biochemical, bacteriological, and pathological research.

MOULTON PARK.

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit, and vegetables are supplied to the Hospital from the farm, gardens, and orchards of Moulton Park. Occupation therapy is a feature of this branch, and patients are given every facility for occupying themselves in farming, gardening, and fruit-growing.

BRYN-Y-NEUADD HALL.

The seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres, at Llanfairfechan, amidst the finest scenery in North Wales. On the North-West side of the Estate a mile of sea coast forms the boundary. Patients may visit this branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout-fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses, and bowling greens. Ladies and gentlemen have their own gardens, and facilities are provided for handicrafts, such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 56, Northampton). who can be seen in London by appointment.

Welbeck 3238

ST. MARY'S HOSPITAL MEDICAL SCHOOL, W.2.

(University of London.)

The WINTER SESSION will begin on THURSDAY, October 1st, 1931.

The Annual Dinner of Past and Present Students will be held on Friday, October 2nd, at the *Trocadero* Restaurant, Sir WILLIAM WILLCOX in the chair.

EXCEPTIONAL SITUATION.	The Hospital is adjacent to a large poor district on the one side, and near to Kensington Gardens and one of the best residential districts in London on the other side, thus providing for the Student the unusual possibility of living in close touch with his work.
ATHLETIC GROUND.	The Athletic Ground (10 acres) is situated at Wembley, and can be reached in 20 minutes from the Hospital.
REBUILDING OF THE MEDICAL SCHOOL.	Building operations were begun in August, 1930, and it is hoped that the new Medical School will be ready for occupation in the Autumn of 1932. The Foundation Stones of the Medical School and Institute of Pathology were laid by H.R.H. The Duchess of York on June 30th, 1931. The new School will include departments for teaching in Inorganic Chemistry, Physics, Biology, Anatomy, Physiology, Organic Chemistry, [illegible]. Special provision is being made for research work in [illegible]. The buildings also include new Administrative [illegible], Students' Club rooms, and a gymnasium and swimming bath.
COMPLETE *CURRICULUM*	The entire Curriculum is provided for Medical Degrees and Diplomas, and Students may join the School at once on passing a Preliminary Examination in Arts.
SPECIAL CLINICAL FACILITIES.	The formation of Clinical Units and the affiliation of other hospitals for teaching purposes have largely extended the scope of the clinical teaching. 1,000 beds are now available for the clinical instruction of Students. Special arrangements have been made for the instruction of Students in Venereal Diseases at the London Lock Hospital, and all Students attend a short course at Queen Charlotte's Maternity Hospital. Recent structural alterations have provided 2 new Operating Theatres and 60 additional beds.
INSTITUTE OF PATHOLOGY.	The Institute of Pathology and Research is under the personal direction of Sir Almroth Wright, F.R.S., and includes seven departments. Students receive special training in Pathology, Bacteriology, and Chemical Pathology by means of clerkships in these subjects tenable for a period of 3 months, 72 of these posts being available in each year.
ENTRANCE SCHOLARSHIPS.	Two Entrance Scholarships of £210 each are awarded by nomination in July annually. The Geraldine Harmsworth Scholarship (£200) and other University Scholarships are awarded by nomination in July annually. The Palmer Scholarship (£25 per annum for two years) is awarded in alternate years.
RESEARCH SCHOLARSHIPS.	Research Scholarships of the value of £200 per annum each are awarded annually for the purpose of enabling newly qualified students to undertake research under the Director of one of the departments included in the Institute of Pathology.
APPOINTMENTS AFTER QUALIFICATION.	Numerous appointments are open to newly qualified members of the Medical School. Six House Physicians (8 months), Eight House Surgeons (8 months), and Four Resident Obstetric Officers (6 months), are appointed annually. Two Resident Anæsthetists (6 months), £150 per annum, Four Casualty House Surgeons (6 months), £100 per annum, with board and residence. Medical Registrar and Surgical Registrar £200 per annum, with partial board. In addition to the above, Five Assistants to the Medical and Surgical Units are appointed from time to time, with salaries ranging from £400 to £750 p.a. C. M. WILSON (*M.C.*), M.D., F.R.C.P., Dean.

The Illustrated Prospectus of the Medical School may be obtained on application to the Secretary.

(Physician Ordinary to H.R.H. the Prince of Wales, Physician to the London Homœopathic Hospital) are given at the Winter Session only on

Fridays, at 5 p.m., October to December—commencing Friday, October 9th.

AN INTRODUCTORY LECTURE TO THE WHOLE EDUCATION COURSE will be delivered at the Hospital on Thursday

October 8th, 1931, at 5 p.m.

By FRANCIS HERVEY BODMAN, M.D., Ch.B.Bristol., Physician to the Bristol Homœopathic Hospital

Subject: "The Foresight of Hahnemann"

All Medical Men and Women are invited to attend this Lecture.

TUTORIAL CLASS.

A class for individual study of the Materia Medica by the Repertory and Reference to Patients are conducted by DOUGLAS W. BORLAND, M.B., Ch.B.Glasg., Physician to the London Homœopathic Hospital, on

Fridays, at 6.15 p.m., October to March—commencing October 9th.

CLINICAL TUTORIALS.

On Monday and Friday afternoons, at 2 o'clock, throughout both the Winter and Summer Sessions, the Registrar Tutor to the Hospital, WILLIAM WILSON RORKE, M.B., C.M.(Edin.), who is also Physician for Diseases of the Nervous System at the London Homœopathic Hospital, and conducts an Out-patient Clinic for the purpose of instruction in the application of Homœopathic principles.

THE SIR HENRY TYLER SCHOLARSHIP COMMITTEE

also offer SCHOLARSHIPS of £20 for Medical Men in the Provinces desirous of taking a Post Graduate Course at the London Homœopathic Hospital during the Ten Compton Burnett Lectures.—Apply to Secretary, London Homœopathic Hospital, Great Ormond St., Bloomsbury, W.C.1.

FEES AND SCHOLARSHIPS

All information as to Fees and Scholarships may be obtained on application to the Secretary of the Education Course, London Homœopathic Hospital, W.C.1.

CENTRAL LONDON OPHTHALMIC HOSPITAL,

JUDD STREET, ST. PANCRAS, W.C.1.

This Hospital makes a speciality of Clinical Instruction in Ophthalmology, and Lectures and Demonstrations are held in various branches of general ophthalmological interest.

A series of Clinical Demonstrations are given at 5 p.m., on the first Tuesday of every month, and Students of Medicine and Medical Practitioners are admitted without fee.

The post of Clinical Assistant is open to Male and Women Students.

For further particulars apply to the Dean of the School.

Preliminary Examinations

The COLLEGE OF PRECEPTORS holds Preliminary Examinations for Medical Students in London and at Provincial Centres in March, June, September, and December. Regulations, apply to the Secretary, College of Preceptors, Bloomsbury Square, London.

UNIVERSITY EXAMINATION POSTAL INSTITUTION

17, RED LION SQUARE, LONDON, W.C.1.

Mr. E. S. WEYMOUTH, M.A.(Lond.), Principal. (FOUNDED IN 1882.) *Telephone*: Holborn 6313.

POSTAL OR ORAL PREPARATION FOR ALL MEDICAL EXAMINATIONS.

SOME SUCCESSES.

M.D. (Lond.), 1901-30: (9 Gold Medallists during 1913-30) 336
M.S. (Lond.), 1902-30 (including 4 Gold Medallists) 22
M.B., B.S. (Lond.), *Final* 1906-30 (Completed Exam.) 269
F.R.C.S. (Eng.), 1906-30. *Primary* 162; *Final* 161
M.R.C.P. (Lond.), 1914-30 192
D.P.H. (Various) 1906-30 (Completed Exam.) 300
F.R.C.S. (Edin.), 1918-30 46
M.R.C.S., L.R.C.P. *Final* 1910-30 (Completed Exam.) 467
M.D. (Dur.) (Practitioners) 1906-30 38
M.D. Various. By Thesis. Numerous successes.

Preparation for Medical Preliminary, and Chemistry, Physics, Anatomy, Physiology, and final subjects for the Conjoint Board, M.B.(Cantab., etc.); also D.P.M., D.O.M.S., D.T.M. & H., D.L.O., D.G.O., D.M.R.E., M.M.S.A., L.M.S.S.A., etc. Numerous successes.

ORAL CLASSES.—M.R.C.P., M.D., Final F.R.C.S., F.R.C.S.(Edin.). Second and Final M.B., B.S., and M.R.C.S., L.R.C.P. Museum and Microscope Work. Also Private Tuition for all Medical Examinations and for the Medical Preliminary Arts and Science Examinations.

MEDICAL PROSPECTUS (48 pp.).

Contents:—The method and the cost of entering the Medical Profession. *Particulars of all Medical Examinations.* Postal Courses, and Oral Classes. Suggestions for the higher Medical Examinations. Suggestions for the higher Surgical Examinations. Suggestions for the Special Diploma Examinations. Refresher Courses. Openings for Women. Hints for writing theses.

Medical Prospectus sent gratis along with list of Tutors, etc., on application to the Principal, Mr. E. S. WEYMOUTH, M.A., 17, Red Lion Sq., London, W.C.1. (Telephone: Holborn 6313.)

THE HOSPITAL FOR SICK CHILDREN,

GREAT ORMOND STREET, BLOOMSBURY, W.C.1.

This Hospital contains 252 beds, with an average admission of 7,000 in-patients per annum; whilst in the out-patient department about 30,000 new patients are seen each year. The Medical School is recognized by the Universities of Oxford, Cambridge, and London, and by the Conjoint Medical Board of England, as a teaching institution where two months' clerking and dressing may be carried out by any undergraduate student who is entering for a final qualifying examination. In addition, for students who have completed four years of medical study, six months of the fifth year may be spent there in clinical work under recognition from the Conjoint Board. Post-graduate instruction, open to all qualified medical men and women, is given daily in the wards, out-patient department, operating theatre, and post-mortem room by members of the visiting staff. In addition, lectures are arranged for them throughout the year, announcements of which are made from time to time, and full details of them can be obtained from the Dean or Secretary at the Hospital. Clinical clerkships in the wards and clinical assistantships in the out-patient department are also available for post-graduate students. Opportunities for study are also offered in the Ophthalmic, Dermatological, Dental, Radiographic, and Pathological Departments.

Fees for Hospital Attendances. One Month's Ticket, £2 2s. Three Months' Ticket, £5 5s. Perpetual Ticket, £10 10s. Special reduced fees for Clinical Clerks, Dressers for one month's attendance, £1 1s. Clerks attend for about four hours daily.

Pathological Department. Facilities are afforded to post-graduates for obtaining theoretical and practical instruction in Clinical Pathology and Bacteriology, and in Medical Biochemistry in the Pathological and Biochemical Laboratories.

Courses of 8 to 10 Lecture Demonstrations are given at weekly intervals twice a year in both subjects (Clinical Pathology and Bacteriology and Biochemistry). These Lecture Demonstrations are of one or two hours' duration.

Fees.—For Course of 8 to 10 Laboratory Demonstrations in either Branch £5 5 0
For combined Course of (a) Clinical Pathology and Bacteriology and (b) Medical Biochemistry £8 8 0

JAMES McKAY, Secretary. ERIC I. LLOYD, F.R.C.S., Dean of the Medical School.

THE GOLDEN SQUARE THROAT, NOSE, AND EAR HOSPITAL,

GOLDEN SQUARE, near PICCADILLY CIRCUS, LONDON, W.1.

HONORARY MEDICAL STAFF:

SURGEONS: Mr. T. Jefferson Faulder; Mr. Lionel Colledge; Mr. Gilbert Chubb; Mr. Theodore Just; Mr. F. Cunliffe Ormerod; Mr. A. R. Dingley.

ASSISTANT SURGEONS: Mr. Gilbert Howells; Mr. S. A. Beards; Mr. J. F. Simpson.

The Hospital has recently been enlarged, and has 73 beds for In-Patients, and an annual Out-Patient attendance of over 50,000.

CLINICAL INSTRUCTION

Clinical Instruction in the Diagnosis and Treatment of Diseases of the Throat, Nose, and Ear is daily given in the Out-Patient Department from 2 to 5 p.m. On Tuesdays and Thursdays from 6.30 to 7.45 also. Major operations are performed daily, except Saturdays, in the In-Patient Operating Theatres. Minor operations are performed in the Out-Patient Department by the Assistant Surgeons on three mornings a week.

Practitioners and Medical Students are admitted to the practice of the hospital, and Clinical Assistants, whose duty it is to assist the staff, are appointed from time to time from among them.

For further information apply to the Dean, Mr. F. CUNLIFFE ORMEROD.

Twenty-four rooms are available for the reception of private patients paying a moderate fee.
Further information may be obtained from the Secretary-Superintendent.

NATIONAL HOSPITAL FOR DISEASES OF THE HEART

WESTMORELAND STREET, W.1.

The Clinical Practice of the Hospital in the Out-patient Department and the Wards is open to Post-Graduates. Fees: One Month £2 2s.; Three Months £5 5s.

Under-Graduates who have completed their fourth year are admitted to the Practice of the Hospital at specially reduced fees.

Special Courses of two weeks' duration are held in January, July, and October. Fee £7 7s.

Further particulars may be obtained on application to the Dean or the Secretary at the Hospital.

THE

METROPOLITAN EAR, NOSE, & THROAT HOSPITAL

(1838) (INCORPORATED),

FITZROY SQUARE, LONDON, W.1.

FACILITIES FOR CLINICAL WORK are afforded to Medical Practitioners and Students. Fee for one month, 3 Guineas; for three months, 5 Guineas.

PRACTICAL DEMONSTRATIONS are given daily (Saturdays excepted), at 3 p.m., in the manipulation of instruments used in the Diagnosis and Treatment of Diseases of the Ear, Nose, and Throat.

CLINICAL ASSISTANTS are appointed as vacancies occur, and have responsible duties.

Further particulars may be obtained from the Secretary.

L. L. PHILLIPS.

LONDON HOSPITAL MEDICAL COLLEGE & DENTAL SCHOOL.

THE WINTER SESSION will Open on Thursday, October 1st.

The Hospital is the largest in England. There are 839 beds in constant use. Last year: number of in-patients, 14,256, out patients 8[illegible], attendances, 529,543; dental patients, 6,063; major operations, 7,401.

The MEDICAL COLLEGE and DENTAL SCHOOL are essentially modern, with large laboratories equipped with the latest and the [illegible] approved appliances. The STAFF is so large as to permit of individual attention being paid to all students.

MEDICAL UNIT.—A Clinical Unit in Medicine, under the charge of a whole-time Director, provides for the more elaborate methods of diagnosis and treatment, and takes a leading part in the initiation and co-ordination of medical research.

RESEARCH FUNDS of approximately £113,000 give unrivalled facilities for Medical Research.

SCHOLARSHIPS and PRIZES to the value of £1,158 are awarded annually, including four Open Entrance Scholarships to the value of £[illegible] and two Entrance Scholarships open to students of the Universities of Oxford and Cambridge to the value of £200.

APPOINTMENTS.—Over 160 Appointments are made annually from Students of the College recently qualified.

SPECIAL COURSES are held for all the University Examinations, for the Primary and Final Fellowship Examination of the Royal [illegible] of Surgeons, and for the Membership Examination of the Royal College of Physicians.

HOSPITAL PRACTICE.—Exceptional opportunities are offered to qualified Practitioners wishing to attend the General Practice or Practice of a Special Department of the Hospital.

A Club's Union, an *Athletic Ground* of over 13 acres, and a *Student's Hostel* promote the recreation, health, and comfort of the [illegible]

For Prospectus and Particulars apply to the Dean (Professor WILLIAM WRIGHT, M.B., D.Sc., F.R.C.S.), who will be pleased to make arrangements for anyone wishing to see the Medical College and Dental School.

MILE END, E.1.

GUY'S HOSPITAL MEDICAL & DENTAL SCHOOLS.

(UNIVERSITY OF LONDON.)

THE HOSPITAL, which contains 646 Beds, is situated one minute's walk from London Bridge Railway Stations.

SPECIAL CLASSES are held in CHEMISTRY, PHYSICS, and BIOLOGY for the First M.B. Examination of the University of London, the Pre-Medical Examination for the "Conjoint" and L.D.S. Diplomas.

THE WINTER SESSION will commence on TUESDAY, SEPTEMBER 29th, 1931.

ENTRANCE SCHOLARSHIPS.—MEDICAL SCHOOL.

The following Entrance Scholarships are awarded annually in the month of June:—

A.—Open Junior Scholarships.—1. An ARTS SCHOLARSHIP of the value of £100. 2. A SCIENCE SCHOLARSHIP of the value of £100. 3. A WAR MEMORIAL SCHOLARSHIP of the value of £200, awarded alternately in Arts and Science. This Scholarship is open every other year; the next award will be made in 1932, in Arts.

B.—Confined Scholarship in Science.—A JUNIOR SCIENCE SCHOLARSHIP of the value of £100 is offered for competition. Candidates who have attended the Preliminary Science Classes at this School.

The following Entrance Scholarships are awarded annually in the month of July:—

C.—Open Senior Science Scholarships.—1. A WAR MEMORIAL SCHOLARSHIP of the value of £100. 2. An EXHIBITION of the value of £60. Subjects: Candidates will be examined in two of the following Subjects, at their option: (1) Anatomy, Embryology; (2) Physiology; (3) Biochemistry; (4) General Pathology, including Bacteriology.

THE DENTAL SCHOOL.

Offers Two Open Scholarships in June of each year:—1. A WAR MEMORIAL SCHOLARSHIP IN ARTS of the annual value of £40 for [illegible] years. 2. A SCIENCE SCHOLARSHIP of the value of £40 per annum for not more than four years.

Numerous Prizes, Medals, and Scholarships are open for competition during the period of Studentship.

For further particulars and for the Prospectus containing information as to the Course of Study advised, the Resident [illegible] &c., application should be made either personally or by letter to *The Dean, Guy's Hospital Medical School, London Bridge, S.E.1*.

LONDON SCHOOL of HYGIENE & TROPICAL MEDICINE

(University of London).

DIPLOMA IN TROPICAL MEDICINE AND HYGIENE (Eng.)

THE COURSE OF STUDY IS NOW DIVIDED INTO TWO PARTS: Section A (Clinical and Laboratory Instruction) and Section B (Tropical Hygiene), each of which can be taken independently of the other, Section A being a three months' course and Section B a two months' course.

This Revised Course of Study is recognised by the University of London as a Course for Associate Students.

DATES OF THE COURSES, 1931-32.

SECTION A (CLINICAL AND LABORATORY INSTRUCTION).

1st COURSE: *29th September*—*18th December*, 1931. 2nd COURSE: *4th January*—*24th March*, 1932.

3rd COURSE: *11th April*—*30th June*, 1932.

SECTION B (TROPICAL HYGIENE).

1st COURSE: *18th January*—*18th March*, 1932. *2nd* COURSE. *18th April*—*17th June*, 1932.

FEES (inclusive): Section A, £25; Section B, £15. *Research Studentships vacant*, value £250 p.a.

DIPLOMA IN PUBLIC HEALTH

The 1931-32 Course of Study, which qualifies students to sit for the UNIVERSITY OF LONDON DIPLOMA, covers a period of nine calendar months in the case of those who devote the whole of their time to the work.

The Course will commence on September 28th, 1931.

Inclusive FEE, 54 guineas, to cover lectures, demonstrations, and the necessary practical work in public health departments, etc.

DIPLOMA IN BACTERIOLOGY

The Course of Study for the academic year 1931-32, qualifying for the UNIVERSITY OF LONDON DIPLOMA, commences in October next. Inclusive FEE, £47 15s.

EPIDEMIOLOGY AND VITAL STATISTICS

Special Three-monthly Advanced Courses. Composition FEE, 7 guineas.

For Prospectuses, Synopses of Lectures, etc., apply to the SECRETARY, LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE, KEPPEL STREET (Gower Street), LONDON, W.C.1.

POST-GRADUATION SCHOOL

Central London Throat, Nose and Ear Hospital

Gray's Inn Road, London, W.C.1

INTENSIVE COURSE of LECTURES and DEMONSTRATIONS, including ANATOMY and PHYSIOLOGY, OPERATIVE SURGERY, PATHOLOGY and BACTERIOLOGY, and PERORAL ENDOSCOPY CLASSES, given in MAY and OCTOBER each year.

PRACTICAL TEACHING Throughout the Year. Courses in methods of Examination and Diagnosis at frequent Intervals; Clinics and Operations Daily; Lectures Weekly.

CLINICAL ASSISTANTSHIPS available for periods of three, six or twelve months.

The Post-graduate work covers all the requirements for the D.L.O. (R.C.P. & S.Eng.).

Full Syllabus obtainable from the Dean.

WEST END HOSPITAL FOR NERVOUS DISEASES.

OUT-PATIENT DEPARTMENT, WELBECK STREET, W.1.

IN-PATIENT DEPARTMENT, GLOUCESTER GATE, REGENT'S PARK, N.W.1.

Recognized by the University of London and the Conjoint Board.

Courses of **SPECIAL CLINICAL DEMONSTRATIONS** on selected cases, as advertised, are given in March-April and November-December.

The general practice of the hospital is conducted daily (Saturdays excepted).

The Savill Prize (value £15) and medal is offered biennially for the best thesis on a neurological subject submitted by Post-Graduates who have attended the hospital practice on not less than 10 occasions.

A limited number of appointments as Hon. Clinical Assistants are open to Post Graduates.

The Senior and Junior House Physicians are appointed every six months, with remuneration at the rate of £150 and £100 per annum respectively.

For particulars of the above apply to C. WORSTER-DROUGHT, M.D., M.R.C.P., Dean, or to the Secretary of the Hospital at 73, Welbeck Street, W.1.

UNIVERSITY OF LONDON

OPHTHALMIC HOSPITAL MEDICAL SCHOOL.

ROYAL LONDON OPHTHALMIC HOSPITAL

(Moorfields Eye Hospital), CITY ROAD, E.C.1.

Qualified Medical Practitioners and Registered Medical Students may enter on the Practice of the Royal London Ophthalmic Hospital (Moorfields) at any time, and are, on certain conditions, eligible for appointment as Chief Clinical Assistant, Clinical Assistant and Junior Assistant.

Courses of Instruction, extending over a period of five months, begin in OCTOBER and MARCH.

1. Practical Refraction Classes.
2. Methods of examination and use of the ophthalmoscope.
3. Lectures every afternoon on the following subjects: (*a*) Anatomy, including Embryology and Normal Histology; (*b*) Physiology; (*c*) Optics, including Physiological Optics; (*d*) Pathology and Bacteriology; (*e*) Ophthalmic Medicine and Surgery, consisting of: Medical Ophthalmology, External Diseases of the Eye, Motor Anomalies and Squint, Diseases of the Retina and Optic Nerve, Diseases of the Uveal Tract.
4. Ophthalmoscopic Conditions: a practical class with demonstrations each week at 5 p.m.
5. Occasional Lectures on subjects allied to Ophthalmology.
6. Operative Surgery. In these classes the usual operations are performed by the student upon pigs' eyes.
7. Practical Pathology. A course of demonstrations on the normal and morbid histology of the eye is given by the pathologist in the laboratory.
8. Practical Bacteriology.
9. Classes in Radiography.
10. Physico-therapy (Ultra-violet Light, Diathermy, etc.).
11. Slit-lamp Microscopy.

FEES.—A composition fee of 35 guineas will admit Students once to all the lectures and classes (except the classes on Physico-Therapy, and Slit-lamp Microscopy, and the examination fee).

DIPLOMA IN OPHTHALMIC MEDICINE & SURGERY & OTHER DEGREES IN OPHTHALMOLOGY.

The above complete curriculum is specially designed to meet the requirements of candidates entering for these examinations.

Fees for the Practice of the Hospital:

Perpetual	£5 5 0	Two months	£2 2 0
Three to six months	£3 3 0	One month	£1 1 0

For further particulars apply to the SECRETARY to the Medical School at the Royal London Ophthalmic Hospital, City Road, E.C.1; or to the Dean, CHARLES GOULDEN, O.B.E., M.D., M.Ch., F.R.C.S.

UNIVERSITY COLLEGE HOSPITAL DENTAL SCHOOL.

NATIONAL DENTAL HOSPITAL, GREAT PORTLAND ST., W.1.

LECTURERS.

Dental Surgery and Pathology.—J. L. DUDLEY BUXTON, L.M.S.S.A., L.D.S.Eng.
Mondays and Wednesdays at 5 p.m. October to March.

Dental Anatomy.—ALAN SHEFFORD, O.B.E., L.D.S.
Mondays at 5 p.m.

Orthodontics.—BERTRAM B. SAMUEL, L.D.S.Eng.
Thursdays at 5 p.m. May to July.

Dental Mechanics.—B. MENDLESON, L.D.S.Eng.
Wednesdays at 5 p.m. January to March.

Dental Materia Medica.—H. DAVIS, B.Sc., A.I.C., Ph.C.
Tuesdays and Fridays at 2 p.m. May to July.

Bacteriology of the Mouth.—Sir KENNETH GOADBY, K.B.E., D.P.H.Camb., L.R.C.P., M.R.C.S., L.D.S.Eng. Wednesdays at 2 p.m. January to March.

General Pathology.—Prof. A. E. BOYCOTT, M.A., D.M., F.R.S.
Mondays, Wednesdays, Thursdays, and Fridays at 12 noon. May.

Practical Pathology.—Prof. C. C. OKELL, M.B., B.C.
Mondays, Tuesdays, Thursdays, and Fridays at 2 p.m. May.

Dental Histology.—A. K. INCE-JONES, L.R.C.P., M.R.C.S., L.D.S.Eng.
Wednesdays at 5 p.m. May to July.

Dental Metallurgy.—H. TERRY, B.Sc.
Tuesdays at 5 p.m. at University College. January to March.

Anaesthetics.—C. W. MORRIS, O.B.E., M.B., B.S.
Alternate Tuesdays at 5 p.m. January to March.

Radiology.—D. A. IMRIE, M.D.Laus., L.R.C.P., L.R.C.S.E., D.M.R.E., L.D.S.
Thursdays at 5 p.m. July.

The WINTER SESSION Commences THURSDAY, OCTOBER 1st, 1931.

This Hospital and School, situated in the centre of a large population, and within a few minutes of University College Hospital, has recently been reorganized and equipped on the highest standard of modern requirements, and is admirably adapted for the teaching of students in every branch of the Science and Art of Dental Surgery. The mechanical laboratory, conservation room, and X-rays department are replete with all the latest approved appliances.

Students (men and women) enter as students of University College Hospital, and attend classes in anatomy and physiology at University College, adjacent to University College Hospital.

Each student serves as a dresser in the extraction, anæsthetic, conservation, and X-rays departments, which provides him with the opportunity of observing and actually carrying out the methods of work in all branches.

Four House Surgeons are appointed half yearly.

The Calendar, containing full information as to lectures, fees, prizes, etc., may be had on application to the Sub-Dean of Dental Students, who attends the University College Hospital Medical School, University Street, Gower Street, W.C.1, on Wednesdays, at 9.30 a.m.

UNIVERSITY COLLEGE HOSPITAL MEDICAL SCHOOL.

Oct.	6 Tues.	Anatomy and Physiology of the Skin	Dr. W. N. Goldsmith.
,,	8 Thurs.	Morphology and Histopathology of Elementary Lesions	Dr. J. M. H. MacLeod.
,,	13 Tues.	Principles of Treatment	Dr. W. Griffith.
,,	15 Thurs.	Pathology Demonstration	Dr. I. Muende.
,,	20 Tues.	Purpura	Dr. H. T. Barron.
,,	22 Thurs.	Mycotic Diseases	Dr. G. B. Dowling.
,,	27 Tues.	Erythema Multiforme	Dr. J. E. M. Wigley.
,,	29 Thurs.	Principles of Treatment. Local	Dr. K. Sibley.
Nov.	3 Tues.	Diseases due to Animal Parasites	Dr. H. MacCormac.
,,	5 Thurs.	Occupational Dermatitis	Dr. W. J. O'Donovan.
,,	10 Tues.	Tuberculosis Cutis (1)	Dr. A. Whitfield.
,,	12 Thurs.	Tuberculosis Cutis (2)	Dr. A. Whitfield.
,,	17 Tues.	Bacteriology and Mycology	Dr. H. W. Barber.
,,	19 Thurs.	Pathology Demonstration	Dr. I. Muende.
,,	24 Tues.	Immunity and Anaphylaxis	Dr. H. W. Barber.
,,	26 Thurs.	Pigmentation of the Skin	Dr. W. N. Goldsmith.
Dec.	1 Tues.	Cutaneous Syphilis (1)	Dr. A. C. Roxburgh.
,,	3 Thurs.	Cutaneous Syphilis (2)	Dr. A. C. Roxburgh.
,,	8 Tues.	Eruptions due to Physical Agents	Dr. A. C. Roxburgh.
,,	10 Thurs.	Pemphigus and Allied Eruptions	Dr. J. E. M. Wigley.
,,	15 Tues.	Erythemato Squamous Eruptions	Dr. S. E. Dore.
,,	17 Thurs.	Pathology Demonstration	Dr. I. Muende.
,,	29 Tues.	Xanthoma. Herpes	Dr. A. M. H. Gray.
,,	31 Thurs.	Electro Therapeutics	Dr. K. Sibley.

1932.		Subject.	Lecturer.
Jan.	5 Tues.	Acne. Rosacea	Dr. H. Hallé Davis.
,,	7 Thurs.	Ringworm Infections	Dr. I. M. H. Muende.
,,	12 Tues.	Cicatricial Alopecia	Sir F. Graham Little.
,,	14 Thurs.	Stocking Erythrodermia	Dr. W. J. O'Donovan.
,,	19 Tues.	Seborrhœa Seborrhœic Dermatitis	Dr. G. B. Dowling.
,,	21 Thurs.	Pathology Demonstration	Dr. I. Muende.
,,	26 Tues.	The Sarcoids	Dr. A. M. H. Gray.
,,	28 Thurs.	Lichen Planus	Dr. M. S. Thomas.
Feb.	2 Tues.	Affections of the Hair and Hair Follicles	Dr. S. E. Dore.
,,	4 Thurs.	Urticaria	Dr. J. A. Drake.
,,	9 Tues.	Diseases of the Buccal Mucous Membrane	Dr. H. C. G. Sutton.
,,	11 Thurs.	Pruritus. Prurigo. Lichenification	Dr. H. Hallé Davis.
,,	16 Tues.	Lupus Erythematosus	Dr. M. S. Thomas.
,,	18 Thurs.	Pathology Demonstration	Dr. I. Muende.
,,	23 Tues.	Leprosy	Dr. J. A. Drake.
,,	25 Thurs.	Leukæmia Cutis. Mycosis Fungoides	Dr. J. F. M. Wilson.
Mar.	1 Tues.	Eczema (1)	Dr. W. Griffith.
,,	3 Thurs.	Eczema (2)	Dr. W. Griffith.
,,	8 Tues.	Common Eruptions in Childhood	Dr. H. T. Barron.
,,	10 Thurs.	Benign Growths of the Skin	Dr. W. N. Goldsmith.
,,	15 Tues.	Malignant Growths of the Skin	Dr. H. McCormac.
,,	17 Thurs.	Pathology Demonstration	Dr. I. Muende.

An Examination will be held at the end of the Course, and the CHESTERFIELD MEDAL will be awarded to the best candidate, provided the required standard is reached.

CLINICS.—Instruction will be given daily in the Out-Patient Department, as follows:

Monday, 2 p.m.	Dr. Griffith.	Wednesday, 2 p.m.	Dr. Dowling.	Friday, 2 p.m.	Dr. Roxburgh.
6 p.m.	Dr. Dore.	6 p.m.	Dr. Wigley.	6 p.m.	Dr. Dowling.
Tuesday, 2 p.m.	Dr. Goldsmith.	Thursday, 2 p.m.	Dr. Sibley.	Saturday, 2 p.m.	The Medical Lecturer.
6 p.m.	Dr. Wigley.	6 p.m.	Dr. Goldsmith.		

LABORATORY.—Arrangements can be made for Classes, individual instruction, or for research work. For particulars and fees apply to the Dean.

FEES.—For Hospital Practice, including Lectures, One Guinea per month; six months, Five Guineas. *Registered Medical Students may attend the Lectures free on signing their names and giving the name of their Hospital.*

Medical Practitioners will be welcome as occasional visitors on presentation of their cards.

For further particulars apply to the Dean.

J. E. M. WIGLEY, M.B., Dean.

LEONARD G. R. TURPIN, Secretary.

ST. BARTHOLOMEW'S HOSPITAL AND COLLEGE

(UNIVERSITY OF LONDON)

WINTER SESSION BEGINS OCTOBER 1st, 1931.

THE HOSPITAL has 762 Beds and the MEDICAL COLLEGE contains large Lecture Rooms and Laboratories, as well as a Museum and a Library.

Every Special Branch of Medicine and Surgery has a Department.

ENTRANCE SCHOLARSHIPS.

Five Entrance Scholarships are awarded in July, of the aggregate value of £410.

Other Scholarships and Prizes amount to about £1,000 annually.

PRELIMINARY SCIENCES.

Biology, Chemistry, and Physics are fully taught in the Laboratories apportioned to these subjects.

HOSPITAL APPOINTMENTS.

Forty House Physicians and House Surgeons are appointed annually from those Students who have passed their final qualifying examination.

Five hundred and sixty Ward Clerkships and Dresserships are open annually to Students before qualification.

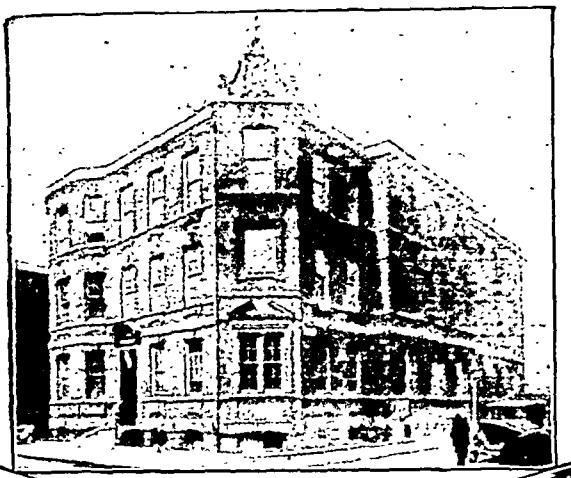
STUDENTS' UNION.

The Union possesses a Club Ground of ten acres within easy reach of the Hospital.

HIGHER EXAMINATIONS.

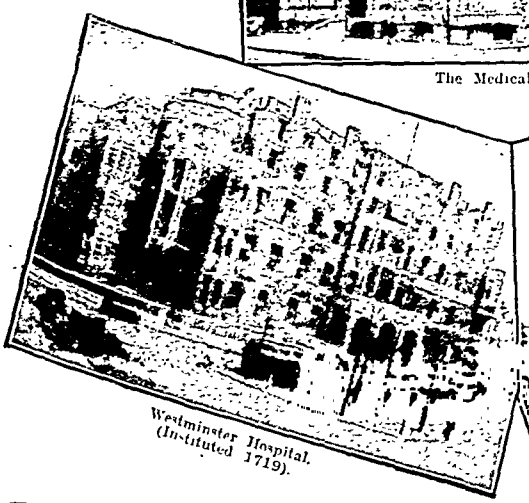
Special Classes are held for F.R.C.S., etc.

For further particulars apply, personally or by letter, to—



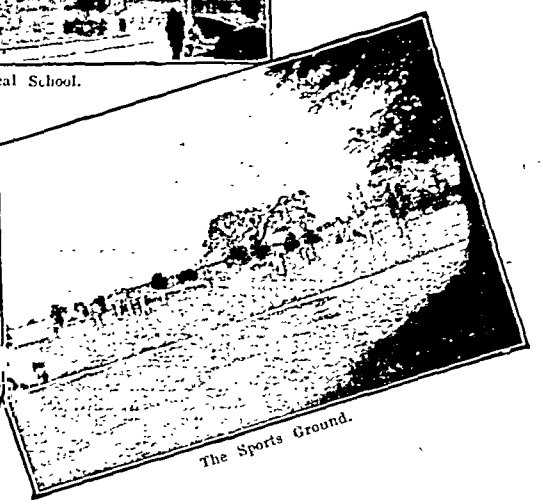
THE DEAN OF THE MEDICAL COLLEGE, St. Bartholomew's Hospital, London, E.C.1.

Westminster Hospital Medical School



(University of London)

SESSIONS COMMENCE 1st WEEK IN JANUARY, APRIL, OCTOBER



NEXT SESSION COMMENCES OCTOBER 1st.

The Medical School.

Westminster Hospital. (Instituted 1719).

The Sports Ground.

THE MEDICAL SCHOOL, with Library, Museum, Lecture Theatres, Epidiascope, &c., is a few minutes' walk from the Hospital. The entire teaching of the Hospital and School is devoted to the subjects of the Final Examinations. Arrangements are made for the tuition required for preliminary and intermediate subjects.

SCHOLARSHIPS. The School Committee is prepared to grant a certain number of Scholarships, each of the value of £75, to men of outstanding merit, upon the nomination of the Dean of their College or the Principal of their School. Five competitive entrance Scholarships to the value of £375, and prizes to the value of £170, are awarded annually.

APPOINTMENTS. Paid appointments as Medical, Surgical, and Obstetric Registrars, Casualty Officers, House Physicians, House Surgeons, Anaesthetists, and Clinical Assistants, are available for Students when they have passed their examinations. There are excellent opportunities for research work in the recently endowed Carlill Laboratories.

FEES. Annual fee £40. An entrance fee of ten guineas includes membership to the Sports Union Club, with its various branches—football, cricket, tennis, boxing, and Guthrie Society. The Sports ground is within 30 minutes of the Hospital.

The Dean or Sub-Dean will be pleased to arrange for intending students and parents to inspect the Hospital and Medical School at any time.

ONLY MALE STUDENTS ARE ADMITTED.

A Prospectus and full particulars may be obtained on application to the Dean:

A. S. WOODWARK, C.M.G., C.B.E., M.D., F.R.C.P.,

Westminster Hospital Medical School, Caxton St., Westminster, S.W.1. Tel.: Victoria 0765.

Rytad

Charing Cross Hospital Medical School

(UNIVERSITY OF LONDON)

Sessions commence October and April.

The most easily accessible of all the Schools of the University.

Complete arrangements for subjects of the whole Medical Curriculum, with special departments for every branch of Clinical work.

The Institute of Pathology, with the abundance and variety of its material and fully equipped laboratories, offers exceptional advantages for Student, Post-Graduate, and Research work.

The Students' Union includes Common Rooms and Restaurant on the School premises, and a Sports Ground of 13 acres within half an hour's journey of the School.

The large number of resident appointments in proportion to the number of students makes it probable that all students of average ability will be able to secure election to the House Staff.

Scholarships. The following are awarded annually. Three "University" Scholarships, each of the value of £120. One "Open" Scholarship of the value of £75, and two "Entrance" Scholarships of £50 each. In addition numerous Exhibitions and Prizes are awarded each year.

MEN STUDENTS ONLY ARE ADMITTED.

Fees 38 Guineas per annum.

For Prospectus and full information apply personally or by letter to the DEAN:—
ERIC A. CROOK, M.A., M.Ch., F.R.C.S., Charing Cross Hospital Medical School, London, W.C.2. Teleph. Nos.: Temple Bar 3903 & 3904.

KING'S COLLEGE HOSPITAL MEDICAL SCHOOL

(UNIVERSITY OF LONDON).

Dean: H. WILLOUGHBY LYLE, M.D., B.S.Lond., F.R.C.S., J.P.

The present HOSPITAL was opened in 1913, and is one of the best equipped Hospitals in England. It serves a population of nearly two millions, and the attendances in the Casualty and Out-patient Departments during the year 1930 amounted to 287,983.

FOURTEEN ENTRANCE SCHOLARSHIPS, total value £1,530, are awarded annually.

RESIDENT HOSPITAL APPOINTMENTS, of which there are sixteen, are made every six months.

ATHLETIC GROUND. The Athletic Ground of the Medical School is within ten minutes' walk of the Hospital, and has accommodation for cricket, football, hockey, and lawn tennis.

SCHOOL HOSTEL. "The Platanes," standing in large grounds, with three lawn tennis courts, provides residence for 80 students, and is within five minutes' walk of the Hospital.

DENTAL SCHOOL. The Dental School was opened in October, 1923. A full Course is given in co-operation with King's College, in preparation for Dental Degrees and Diplomas.

For Particulars, Calendar of the School, and Appointments to see the School and Hospital, application should be made to the Secretary, S. C. RANNER, M.A.Cantab., King's College Hospital Medical School, Denmark Hill, London, S.E.5.

THE MIDDLESEX HOSPITAL MEDICAL SCHOOL

UNIVERSITY OF LONDON.

WINTER SESSION BEGINS ON OCTOBER 1st.

The entire Medical Curriculum can be taken at this School. There is no accommodation for Women Students. Annual value of Scholarships and Prizes £1,000. Large Research Funds.

STAFF INCLUDES 6 UNIVERSITY PROFESSORS, 2 UNIVERSITY READERS, 29 LECTURERS, 8 DEMONSTRATORS, and 4 TUTORS.

ENTIRE CURRICULUM.—THE PROVISION WHEREBY ALL THE SUBJECTS OF THE CURRICULUM, INCLUDING CHEMISTRY, PHYSICS AND BIOLOGY, FOR THE PRE-MEDICAL EXAMINATION, ARE TAUGHT WITHIN THE PRECINCTS of the HOSPITAL and MEDICAL SCHOOL, and every effort made to encourage co-ordination, ensures that the student, instead of proceeding to the study of the various subjects as if they were isolated and having little or no relation to each other, is taught each subject by professors and lecturers who are instructing medical students only, and are in close touch with all the other departments of the School. The rebuilding of the Hospital and completion of new buildings in connection with the Medical School have now reached such a point that those working in the Institution have facilities equal to, or superior to those to be found in any other hospital in the United Kingdom, and the rapid progress which is being made with the remaining buildings promises even greater facilities in the immediate future. The new buildings are not confined to the wards, but include a magnificent Nurses' Home, a new Out-patients' Department, the Institute of Biochemistry, and new departments of Neurology, Dermatology, etc. The following description of the work in various departments is designed to show how co-ordination is carried out.

CHEMISTRY is taught by Professor W. B. Tuck, and the class room and laboratories are in the immediate vicinity of those for anatomy, physiology, pharmacology, pathology, and bacteriology. This leads to a close association with these departments and the student realises he is not learning just the chemistry which he requires for his first professional examination, but is acquiring knowledge which he will need and have to apply in later years. Professor Tuck also gives instructions in Toxicology and in the Chemistry required by candidates for the DIPLOMAS IN PUBLIC HEALTH, so keeps in touch with students in their final years and also in their post graduate studies.

THE PHYSICS DEPARTMENT is under the charge of Professor Sidney Russ, who is also Physicist to the Hospital and engaged in research work on the measurements and dosage of X-ray and Radium emanations. He is therefore in close touch with the departments of physiology and pathology, and takes an active part in departments for clinical therapeutics. Under his direction the student will realise at once that he is not studying an isolated subject for the purpose of training his mind or simply to comply with regulations and pass an examination, but is in touch with a subject which will be of great and increasing importance in the proper understanding of his work in later years.

BIOLOGY.—The Lecturer on Biology is Dr. J. H. Woodger, who holds a University Readership in this subject. His teaching in biology is characterized by co-ordination with other departments, and the bearing of the subject on the later stages of the curriculum is emphasized. Not only is the subject taught as an introduction to the study of Anatomy and Physiology, but the increasing importance of a knowledge of the lower forms of vegetable life and of the protozoa in the causation of disease and the study of insect carriers of human diseases is emphasized by co-ordination with the Pathological Institute.

IN THE DEPARTMENT OF ANATOMY, under the direction of Professor Thomas Yeates, with the general scientific study of Anatomy and its wider Biological aspects, the relation of structure to function and pathology is not lost sight of. Facts of clinical medicine and surgery, of pathology, biology, and physiology, are included in the teaching in order to emphasize the significance of anatomical points. By classes in Applied Medical and Surgical Anatomy the study of this subject is continued in the later stages of the student's career.

THE TEACHING OF PHYSIOLOGY is in the hands of Professor Samson Wright, and the department is in close touch with those for the teaching of both the preliminary and final subjects of the curriculum. It is impressed upon the student in this department that he cannot be a good clinician unless he obtains a sound knowledge of Physiology. Later in his career the student has continuous opportunities of applying what he has learnt in the Physiological department, and his physiological knowledge is further extended, notably in the study of PHARMACOLOGY and in the CARDIOGRAPHIC Department, where he has opportunities of studying the electrical conditions of the heart both in health and disease.

IN THE BLAND-SUTTON INSTITUTE OF PATHOLOGY all the departments of the Medical School are brought in touch. Here the student learns the SCIENCE OF DISEASE. The teaching of Pathology is in the hands of Professor J. McIntosh and under his tuition the student is made to realise that Pathology and Medicine are one and that a clear knowledge of Pathology and Bacteriology is essential for the prevention, diagnosis, and treatment of disease. The teaching of pathology is brought into the closest touch with clinical teaching, and the student sees the practical application of the sciences in which he has been instructed in the earlier years of the curriculum—chemistry, physics, biology, anatomy, and physiology.

THE COURTAULD INSTITUTE OF BIOCHEMISTRY is a new building fully equipped with laboratories for teaching and biochemical research. Professor E. C. Dodds, who is in charge of the Department, holds complete courses in Biochemistry for students, both in their early years and during their period of instruction in the wards. In addition to this the student here acquires constant practical experience of the important modern chemical investigations necessary for the detection of disease and the study of its evolution. Several valuable post graduate appointments in this Institute become available to students showing special ability in this direction.

CLINICAL TEACHING is carried out in the general wards and out-patients' departments, and in the special departments, all of which are in close touch with the scientific departments in the School. The student has ample opportunities for carrying out the physical examination of patients, and with his training on the scientific side combines instruction in the Art of Medicine by constantly being brought in contact with patients and being made to realise the human side of his professional work. In order that the student may have ample bedside teaching and opportunities for carrying out the examination of patients himself, the number of students allowed at a Clinique is limited.

There are ample clinical appointments for all students, and twenty-five Resident appointments are open annually to students of the School who have obtained their degrees or diplomas.

THE SOCIAL AND ATHLETIC side of the student's life has been arranged for. There are large athletic grounds with new Pavilion, restaurant, and gymnasium. Common Room Society, Medical Society, Musical Society, and various other Clubs.

Write for Prospectus to the DEAN, T. IZOD BENNETT, M.D., B.S., F.P.C.P., Middlesex Hospital Medical School, Berners Street, London, W.1.

ST. GEORGE'S HOSPITAL MEDICAL SCHOOL

(UNIVERSITY OF LONDON).

HYDE PARK CORNER, S.W.

THE HOSPITAL and MEDICAL SCHOOL occupy the finest site in London and are readily accessible from all parts of the Metropolis.

The entire teaching in the School is devoted to the subjects of the Final Examinations; in other words, is specially adapted to the interests of men from the Universities who have passed their Examination in Anatomy and Physiology.

By arrangement with the authorities of King's College and University College, St. George's Students attend at those Colleges for tuition in the Preliminary and Intermediate subjects.

SEVEN ENTRANCE SCHOLARSHIPS IN ANATOMY AND PHYSIOLOGY, AND GENERAL PATHOLOGY, of the value of £120, £80 (3), £60 (2), and £50 respectively, are awarded in July to candidates who have passed the 2nd M.B. or corresponding examination. In addition, EXHIBITIONS, each of the value of £40 and up to Four in number, will be awarded to candidates of approved merit in the Entrance Scholarship Examination.

MANY VALUABLE PRIZES ARE AWARDED EACH YEAR, including the following:—Allingham Scholarship of the value of £87, Laking Memorial Prize of the value of £65, the Brackenbury Prize in Medicine, the Brackenbury prize in Surgery, and the Webb Prize in Bacteriology, each of the value of £33.

RESIDENT APPOINTMENTS may be held for four, eight, or twelve months. A Student of ordinary ability should have an excellent chance of obtaining these posts and afterwards one of the following Paid appointments for a short time. Resident Assistant Physician, £250; Resident Assistant Surgeon, £250; Medical Registrar, £200; Surgical Registrar, £200; Assistant Curator of the Museum, £100; Resident Anæsthetist, £100; Resident Obstetric Assistant, £100.

The ST. GEORGE'S HOSPITAL CLUB incorporates the RUGBY FOOTBALL, CRICKET, LAWN TENNIS, BOXING, RIFLE and other Clubs, and possesses an ATHLETIC GROUND within easy reach of the Hospital, and Smoking and Luncheon Rooms on the School Premises.

Entrance Fee, £10 10s. 0d. Annual Composition Fee, which covers all courses, lectures, etc., in the Hospital and School, £42. Annual Club Subscription, £3 3s. 0d.

The Winter Session will begin on October 1st, but students can enter at any time.

Further information may be obtained from the Dean of the Medical School.

A. FEILING, M.D., F.R.C.P.,
Dean.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL

(UNIVERSITY OF LONDON).

THE WINTER SESSION BEGINS on THURSDAY, OCTOBER 1st, 1931.

SITE.—The Hospital occupies the finest open site in London, facing the River and the Houses of Parliament.

SCIENCE, ANATOMY, AND PHYSIOLOGY.—Classes and Lectures in all Elementary and Intermediate subjects provide complete instruction for the University and the Conjoint Board Examinations.

CLINICAL WORK.—The facilities for Clinical work are second to none in London. Clerks and Dressers, who work under the immediate supervision of the Staff, are appointed every three months in all General and Special Departments of the Hospital.

SPECIAL DEPARTMENTS.—The Special Departments in the Hospital provide Clinical Instruction in all Special subjects.

In connection with the DEPARTMENT OF OBSTETRICS AND GYNÆCOLOGY all Students attend the practice of the MATERNITY WARD before proceeding to work in the district.

THE PRIMARY F.R.C.S. CLASSES will commence on Tuesday, September 8th.

THE FINAL F.R.C.S. COURSE will commence during the second week in October.

ENTRANCE SCHOLARSHIPS.—One in Arts, free course for first 2 years of Study. Two in Science (Pre. F. Standard) £150 and £60. Two for University Students (Anatomy, Physiology, Pathology, Applied Chemistry, any two subjects) £100 and £60.

ST. THOMAS'S HOUSE.—A residential Club for Students has recently been opened, providing accommodation for some 60 resident Students, and including spacious Club rooms, etc. The SPORTS GROUND is within easy reach of the Hospital.

ANNUAL FEE.—£50 for each Year of Study. The Annual Fee covers the cost of all Lectures, Classes, etc., except the following: "Fevers," £3 3s. 0d.

AMALGAMATED CLUBS: Entrance Fee £2 2s. 0d.; Annual Subcription £5 5s. 0d.

Full particulars may be had by application to:

R. J. C. THOMPSON, C.M.G., D.S.O., M.D.Durh., M.R.C.P.Lond.,
Secretary to the Medical School, St. Thomas's Hospital, Lambeth Palace Road, S.E.1.
Professor LEONARD S DUDGEON, C.M.G., C.B.E., F.R.C.P.Lond., Dean.

THE UNIVERSITY OF LEEDS

SCHOOL OF DENTISTRY

The First Term begins on **October 1st, 1931.**

The degrees of B.Ch.D. and M.Ch.D., as well as a diploma, L.D.S., are conferred by ıe University.

The systematic Classes and Lectures are held in the School of Medicine and School of)entistry of the University, while the clinical instruction is given in the Leeds General Infirmary nd Dental School Hospital. The combined courses of study are arranged to meet the Jniversity Regulations in the first instance, but they also afford every opportunity for study o students preparing for the dental examinations of other Licensing Bodies.

Intending students can enter as pupils in the Dental School and can obtain instruction n the preliminary scientific subjects in the Department of Science of the University.

For further particulars application should be made to:—
The Warden, School of Dentistry, Leeds.

HE UNIVERSITY OF LEEDS

FACULTY OF MEDICINE

SCHOOL of MEDICINE and THE GENERAL INFIRMARY at LEEDS

The First Term begins on **October 1st, 1931.**

The degrees of M.B., Ch.B., Ch.M. and M.D. are conferred, and diplomas in Public Health and Psychological Medicine are granted by the University.

The systematic Classes and Lectures are held in the School of Medicine of the University while the Clinical instruction is given in the General Infirmary. The combined courses of study are arranged to meet the University Regulations in the first instance, but they also afford every opportunity for students preparing for the examinations of any licensing body.

The instruction in the subjects for the First Examination is given in the Department of Science of the University.

The Composition Fee for the Academic Courses and Clinical instruction is £242.

For further particulars application should be made:—
Regarding instruction given at the University to The Academic Sub-Dean, School of Medicine, Leeds.
Regarding instruction given at the Infirmary to The Clinical Sub-Dean, General Infirmary, Leeds.

UNIVERSITY OF DURHAM
COLLEGE OF MEDICINE
NEWCASTLE-UPON-TYNE.

The degrees in Medicine, Surgery, Hygiene, and Dentistry, the Diploma in Public Health, the Diploma in Psychiatry, and the Licence in Dental Surgery of the University of Durham are open to men and women.

The WINTER SESSION, 1931-32, will be commenced on THURSDAY, OCTOBER 1st.

Students can complete, at the University of Durham College of Medicine, Newcastle-upon-Tyne, the entire course of professional study required for the above degrees, diplomas, and licence; also for the Examinations of the Royal Colleges of Physicians and Surgeons and other Examining Bodies.

Hospital practice is carried out at the Royal Victoria Infirmary, a general hospital containing more than 600 beds, and there are facilities for the study of the various special subjects. General and Special Post-Graduate Courses are held.

Practical Midwifery can be studied at the Princess Mary Maternity Hospital, which contains 90 beds, with an annual indoor and outdoor attendance on 3,000 cases. Lectures are given on Psychological Medicine in the College of Medicine, and clinical instruction at the Mental Hospital, Newcastle. Clinical instruction in Infectious Diseases is given by the Medical Officer of Health in the City Hospital at Walkergate.

A Dental Department has been established, which includes a dental hospital, newly erected and equipped on the most modern lines, with abundant material for clinical teaching and facilities for training in practical dental mechanics.

Particulars may be obtained from the DEAN of the College.

UNIVERSITY OF BIRMINGHAM
FACULTY OF MEDICINE
(Associated with the General, Queen's, and Special Hospitals for Clinical Teaching.)

THE NEXT SESSION OPENS ON OCTOBER 5th, 1931.

The University grants Degrees in Medicine, Surgery, and Public Health, and a Diploma in Public Health; also Degrees and a Diploma in Dental Surgery.

The courses of instruction are also adapted to meet the requirements of other Universities and Licensing Bodies.

HOSPITAL APPOINTMENTS.

A large number of Resident Hospital appointments in Birmingham and District are open to qualified students of the School.

SCHOLARSHIPS, EXHIBITIONS, AND PRIZES.

Entrance and other Scholarships and Exhibitions and various Prizes and Medals are awarded annually in the Faculty of Medicine.

SCHOOL OF DENTISTRY. (University of Birmingham and Birmingham Dental Hospital)

The School of Dentistry, in conjunction with the General and Queen's Hospitals, affords a complete curriculum for the Dental Diploma and Dental Degrees of the University and all other Licensing Bodies. A Dental Scholarship of the value of £45 17s 6d. is offered annually.

PRE-MEDICAL AND PRE-DENTAL EXAMINATIONS.

The necessary Courses of Instruction in Chemistry and Physics and in Biology may be attended in the University.

For Syllabus and further information apply to STANLEY BARNES, M.D., D.Sc., F.R.C.P., Dean.

THE UNIVERSITY OF SHEFFIELD.
Vice-Chancellor: A. W. PICKARD-CAMBRIDGE, M.A., D.Litt.

FACULTY OF MEDICINE.
Dean: Professor J. S. C. DOUGLAS, M.A., M.D., B.Ch., M.Sc.

The University grants Degrees in Medicine (M.B., Ch.B., M.D., Ch.M.), and in Dental Surgery (B.D.S., M.D.S.). It also grants a Diploma in Dental Surgery (L.D.S.). These are all open to men and women on equal terms.

The session 1931-1932 begins on October 7th.

Lectures and laboratory courses are given in the University, whilst clinical instruction is provided in the General and special Hospitals in the City.

Although the teaching is primarily directed towards the requirements of the University the instruction usually covers those of other examining bodies.

A number of resident hospital appointments are open to qualified students of the school.

Halls of Residence.—There are four Halls of Residence, one for men students and three for women students.

Scholarships.—A number of Entrance Scholarships are open to students wishing to enter the Faculty of Medicine. There are also post-graduate scholarships.

A prospectus containing all necessary details of the School, and one giving particulars of scholarships, may be obtained free from—

W. M. GIBBONS, Registrar.

MANCHESTER UNIVERSITY MEDICAL SCHOOL

POST-GRADUATE COURSES IN MEDICINE AND SURGERY.

The following arrangements have been made for Post-Graduate teaching in Manchester during 1931-32:

1. ANCOATS HOSPITAL:
   A Post-Graduate Day on Thursdays during the University terms. Syllabus available at the beginning of October. No fee charged.
2. PART-TIME COURSES:
   (a) In Ophthalmology (Royal Eye Hospital)—October 6th to November 19th, 1931. Tuesdays and Thursdays. Fee £3 3s.
   (b) In Diseases of the Skin (Skin Hospital, Quay Street)—February 8th to 20th, 1932. Twelve Clinical Demonstrations. Fee £3 3s.
   (c) In Practical Instruction in Local Anaesthesia and Minor Operative Surgery (Salford Royal Hospital)—Wednesdays, October 14th to December 2nd, 1931. Fee £3 3s.
   (d) In Practical Clinical Medicine (Salford Royal Hospital)—Wednesdays, February 3rd to March 9th, 1932. Fee £2 2s.
3. CLINICAL ASSISTANTSHIPS.—Maximum fee £4 4s.
4. RADIUM THERAPY.—Clinical Assistantships at the Manchester and District Radium Institute, one day per week, for three months. Fee £4 4s.

Syllabus and other information may be had on application to the Dean of the Medical School.

UNIVERSITY OF MANCHESTER

FACULTY OF MEDICINE.

The WINTER SESSION commences on OCTOBER 8th.

The Laboratories and Museums afford every facility to students and Graduates for Practical Instruction, as well as for Original Research

SCOPE OF INSTRUCTION.

Complete Courses of Instruction are offered for the Examinations of the University of Manchester and also for the Examinations of other Examining Bodies in the United Kingdom Post-Graduate Courses are held in preparation for the Diploma in Psychological Medicine (Manch.), the Certificate in Venereal Diseases and in various branches of Medicine and Surgery In the Dental Department Complete Courses are given preparing for the Degrees and Diploma in Dentistry granted by the University as well as for the Diploma of the Royal College of Surgeons of England, and other Dental Diplomas The Public Health Laboratories are situated at a short distance from the University The fullest opportunities are offered to Graduates and others in preparation for the Diplomas in Bacteriology in Pathology in Public Health, and in Veterinary State Medicine and for Special Certificates in School Hygiene and Factory Hygiene Particulars may be obtained from the Dean of the Medical School

OPPORTUNITIES FOR CLINICAL STUDY—ROYAL INFIRMARY AND OTHER HOSPITALS.

The Clinical Instruction is given in the new Royal Infirmary, opened in 1909 on a site near to the Medical School It is provided with every modern requirement for the treatment of the sick and the investigation of disease Instruction in Special Subjects is given in other Hospitals associated with the University A large number of beds in the General and in the Special Hospitals are available, thus affording unrivalled opportunities for Clinical Study

1 The Manchester Royal Infirmary	614 beds	6 Fever Hospital for Infectious Diseases	600 beds
2 The St. Mary's Hospitals for Women and Children	216 beds	7 Special Hospitals for Diseases of the Ear Throat and Chest, Skin, and the Christie Cancer Hospital	260 beds
3 Manchester Children's Hospital	190 beds		
4 Manchester Royal Eye Hospital	130 beds	8 Dental Hospital of Manchester	136 beds
5 Manchester Northern Hospital for Women and Children	73 beds	9 Ancoats Hospital	263 beds
		10 Salford Royal Hospital	

HOSPITAL APPOINTMENTS.

In consequence of the large number of Hospitals associated with or in the vicinity of, the University, exceptional opportunities are offered to Graduates to obtain Resident Hospital Appointments

SCHOLARSHIPS, EXHIBITIONS, AND PRIZES.

Two Open Entrance Scholarships for Graduates, each of the value of 160 guineas, are offered yearly in July In addition the Dreschfeld Scholarship of £20 per annum, the John Russell Medical Entrance Scholarship of £45 per annum, and other Entrance Scholarships of the value of £30 to £40 a year for two or three years, are also tenable in the Medical Faculty

Fellowships, Scholarships, etc., are also offered for competition to Students of the Faculty

RESIDENCE FOR UNDERGRADUATES.

There are Halls of Residence both for Men and for Women Students, and lodgings can be recommended. Prospectuses will be forwarded on application to the Registrar

THE UNIVERSITY OF LIVERPOOL.

FACULTY OF MEDICINE.

THE MEDICAL SCHOOL provides complete courses of instruction for the Examinations of the University of Liverpool, and also meets the requirements of other Universities and Examining Bodies in the United Kingdom.

Other Schools of the Faculty are:—The School of Dental Surgery, the School of Hygiene, the School of Tropical Medicine, and the School of Veterinary Science.

DEGREES AND DIPLOMAS IN THE FACULTY OF MEDICINE.

Bachelor of Medicine & Bachelor of Surgery	M.B., Ch.B.	Master of Veterinary Science	M.V.Sc.
Doctor of Medicine	M.D.	Doctor of Veterinary Science	D.V.Sc.
Master of Surgery	Ch.M.	Doctorate in Philosophy	Ph.D
Master of Hygiene	M.H.	Licence in Dental Surgery	L.D.S.
Master of Orthopaedic Surgery	M.Ch.Orth.	Diploma in Public Health	D.P.H.
Bachelor of Dental Surgery	B.D.S.	Diploma in Tropical Medicine	D.T.M.
Master of Dental Surgery	M.D.S.	Diploma in Tropical Hygiene	D.T.H.
Bachelor of Veterinary Science	B.V.Sc.	Diploma in Veterinary Hygiene	D.V.H.
		Diploma in Medical Radiology & Electrology	D.M.R.E.

Valuable Fellowships, Scholarships, and Prizes are offered for competition each year.

THE CLINICAL SCHOOL consists of FOUR GENERAL HOSPITALS: The Royal Infirmary, the Royal Southern Hospital, the David Lewis Northern Hospital, and the Stanley Hospital; and of FIVE SPECIAL HOSPITALS: The Eye and Ear Infirmary, the Hospital for Women (including the Samaritan Hospital), the Royal Liverpool Children's Hospital, the Liverpool Maternity Hospital, and the St. Paul's Eye Hospital.

These Hospitals contain in all about 1,500 Beds.

The organization of these Hospitals to form one teaching Institution provides the Medical Student and Medical Practitioner with a field for clinical education and study which is unrivalled in extent in the United Kingdom.

Infectious Diseases are studied in the Local and District Hospitals, and Mental Diseases at the County Mental Hospital, Rainhill.

For information on all matters concerning the curriculum application should be made to the Dean of the Faculty of Medicine, the University of Liverpool.

W. J. DILLING, Dean.

THE CLINICAL SCHOOL,

UNIVERSITY OF LIVERPOOL.

The following Hospitals are associated for purposes of Clinical Instruction, and form the Clinical School of the University:—

THE ROYAL INFIRMARY.	THE STANLEY HOSPITAL.	THE HOSPITAL FOR WOMEN (Including the SAMARITAN HOSPITAL).
THE ROYAL SOUTHERN HOSPITAL.	THE EYE AND EAR INFIRMARY.	LIVERPOOL MATERNITY HOSPITAL.
THE DAVID LEWIS NORTHERN HOSPITAL.	ROYAL LIVERPOOL CHILDREN'S HOSPITAL.	ST. PAUL'S EYE HOSPITAL.

The Staffs of these Hospitals form the Teaching Staff of the Clinical School. There are over 1,500 beds in the Associated Hospitals, affording a field for Clinical Instruction which is unrivalled in the United Kingdom.

Twenty-one house physicians and house surgeons are appointed every six months in the General Hospitals, and the majority of these receive salaries ranging from £60 to £100 per annum. A number of resident medical officers are also appointed at intervals to the Special Hospitals.

Information regarding the regulations for Hospital Practice may be obtained from the Secretary of the School,
J. C. MATTHEWS, M.A., M.D., F.R.C.P., 61, Rodney Street.

UNIVERSITY OF BRISTOL.

FACULTY OF MEDICINE.

The WINTER SESSION commences on 2nd October, 1931.

The University grants the Degrees of *Bachelor of Medicine* and Surgery (M.B., Ch.B.), Master of Surgery (Ch.M.), Doctor of Medicine (M.D.), Bachelor of Dental Surgery (B.D.S.), and Master of Dental Surgery (M.D.S.), as well as diplomas in Public Health (D.P.H.), and Dental Surgery (L.D.S.).

The lectures and laboratory courses which are given in the University, although primarily designed for the degrees and diplomas of the University, are equally adapted to those of other Universities and Examining Boards, and Students preparing for such external degrees and diplomas have equal attention paid to them.

Hospital Practice and Clinical Instruction are provided in the Hospitals and Asylum of the City, associated with the University for this purpose, and Students have exceptional opportunities of studying the practice of medicine from a large variety of cases.

Women are admitted to all Classes, Lectures, and Laboratory Practice, and attend them with men. The Halls of Residence for Men and for Women Students are situated in Clifton, near the University.

INCLUSIVE FEES—

For the M.B., Ch.B., curriculum ...	205 guineas.
For the B.D.S. curriculum, including Mechanical Laboratory	215 "
Do. excluding Mechanical Laboratory	155 "
For the L.D.S. curriculum, including Mechanical Laboratory	200 "
Do. excluding Mechanical Laboratory	140 "
For Mechanical Laboratory alone ...	60 "

For additional particulars apply to Professor Edward Mellanby, M.D., F.R.S., Dean.

UNIVERSITY COLLEGE, DUBLIN,
MEDICAL SCHOOL.

SESSION 1931-32.

WINTER SESSION—Lectures commence on October 12th; Introductory Course on October 6th.

PROFESSORS AND LECTURERS

Anatomy.
Professor—EDWARD PATRICK McLOUGHLIN, B.A., M.B., B.Ch., B.A.O.

Physiology.
Professor—JAMES M. O'CONNOR, B.A., M.D.

Zoology.
Professor—J. BAYLEY BUTLER, M.A., M.B., B.Ch., B.A.O.

Botany.
Professor—JOSEPH DOYLE, B.A., D.Sc.

Chemistry.
Professor—Vacant.
Lecturers—JOSEPH ALGAR, B.A., D.Sc. JOHN KEANE, M.Sc., Ph.D.

Physics.
Professor—JOHN J. NOLAN, M.A., D.Sc.
Lecturers—JOHN J. DOWLING, M.A., F.INST.P., PATRICK J. NOLAN, D.Sc.

Pathology and Bacteriology.
Professor—THOMAS J. O'FARRELL, F.R.C.S.I., D.P.H.
Lecturer in Special Pathology—W. M. CROLTON, B.A., M.D.

Public Health and Bacteriology.
Professor—WILLIAM D. O'KELLY, B.A., M.D., D.P.H.

Medicine.
Professor of Medicine—HENRY J. MOORE, M.D., D.Sc.
Professor of Systemic Medicine—JAMES N. MEENAN, M.B., B.Ch., B.A.O., D.P.H.

Surgery.
Professor of Surgery—HENRY L. BARNVILLE, B.A., M.D., M.Ch.
Professor of Systemic Surgery—HENRY S. MEADE, F.R.C.S.I.

Midwifery and Gynæcology.
Professor—ROBERT P. FARNAN, M.B., B.Ch., B.A.O.
Lecturer (Obstetrics)—JAMES J. O'KELLY, B.A., M.B., B.Ch., M.A.O.
Lecturer (Gynæcology)—REGINALD WHITE, F.R.C.S.I.

Materia Medica and Therapeutics.
Professor—THEOBALD W. J. DILLON, M.B.

Ophthalmology.
Professor—LOUIS WERNER, B.A., M.B., F.R.C.S.I.

Medical Jurisprudence.
Lecturer—JOHN McGRATH, M.Sc., M.B.

Dental Surgery.
Professor—T. SHERIDAN, M.D.S., F.R.C.S.I., L.D.S.

Dental Mechanics.
Professor—J. J. POTTER, M.D.S., L.D.S.

Orthodontia.
Lecturer—LAURENCE FLANAGAN, B.D.S., M.B., B.Ch.

All Scholarship Examinations in Medicine will be held on October 1st.

Introductory Course.—Particular attention is paid to beginners for whom a special Introductory Course is delivered at the commencement of the Winter Session, beginning on October 6th.

Regulations for Courses of Study for Degrees, and General Regulations containing information as to Scholarships, etc., may be obtained from the REGISTRAR, University College, Dublin.

ROTUNDA HOSPITAL, DUBLIN.

THE HOSPITAL contains 127 beds. Upwards of 2,000 maternity cases and 1,000 gynæcological patients are treated during the year. Besides the Hospital there is an extern Maternity Department with over 2,000 cases. The routine for Students consists of attendance at the Morning Lectures on Midwifery and Gynæcology, examination of patients in the Gynæcological Department, attendance at operations and the abnormal labours in the Hospital Wards and conduction of labour cases in the intern and extern departments. The Ante-Natal Clinic, the Infants' Ward and Dispensary, and Pathological Laboratory are available also. An X-Ray department is attached to the Hospital.

Qualified Students are allowed to assist at the major and perform some minor gynæcological operations.

The Hospital Courses are always going on during the year, and Students can join at any time. The Class is limited, therefore it is advisable to register in advance. Board and lodging can be obtained in the Hospital.

Extra classes in gynæcological diagnosis and operative midwifery are conducted by the Assistants to the Master.

Fees, one month, £6 6s., months other than the first, £4 4s., three months, £12 12s., L.M. Course, £21.

The L.M. certificate is given to qualified practitioners on examination after six months' attendance at the Hospital.

Full particulars from Bethel Solomons, M.D., Master, Rotunda Hospital.

UNIVERSITY OF DUBLIN
SCHOOL OF PHYSIC.
TRINITY COLLEGE.

THE WINTER SESSION will begin on 1st October, 1931.

All information regarding Courses for the Medical and Dental Degrees, for the Diploma in Public Health, for the Diploma in Gynæcology and Obstetrics, and for the Diploma in Psychological Medicine may be obtained on application to the Registrar, School of Physic, Trinity College, Dublin.

THE APOTHECARIES' HALL OF IRELAND.

DIPLOMA in MEDICINE SURGERY, MIDWIFERY and PHARMACY.

EXAMINATIONS are held twice yearly, January and June.

For particulars apply to THE SECRETARY, Apothecaries Hall, 95 Merrion Square, Dublin.

LIVERPOOL SCHOOL OF TROPICAL MEDICINE.

(UNIVERSITY OF LIVERPOOL)

COURSES OF INSTRUCTION (lasting about three months) for the Diploma in Tropical Medicine commence on January 6th and October 1st, and for the Diploma in Tropical Hygiene on January 13th and April 23rd. (Candidates for the D.T.H. must possess the D.T.M. of this University.)

For particulars apply to the Hon. Dean, Liverpool School of Tropical Medicine, Pembroke Place, Liverpool.

UNIVERSITY OF EDINBURGH.

Principal—Sir THOMAS H. HOLLAND, K.C.S.I., K.C.I.E.

The WINTER SESSION, 1931-32, opens on October 6th and closes on March 18th.
The SUMMER SESSION, 1932, opens on April 19th and closes on July 1st.

FACULTY OF MEDICINE.

Dean—Professor SYDNEY SMITH, M.D., D.P.H.

The Faculty embraces 18 Professors and 80 Lecturers, and attached to these there are about 40 Assistants and Demonstrators. Instruction is given in all the main branches of Medical Science, viz.:—

PROFESSORS.

Chemistry—George Barger, D.Sc., F.R.S.
Zoology—J. H. Ashworth, D.Sc., F.R.S.
Botany—Wm. Wright Smith, M.A., F.R.S.
Anatomy—J. C. Brash, *M.C.*, M.A., M.D.
Physiology—Sir E. Sharpey-Schafer, LL.D., F.R.S.
Materia Medica—Alfred J. Clark, *M.C.*, M.D., F.R.C.P.
Pathology—
[illegible] Mackie, M.D.
[illegible] Smith, M.D., D.P.H.
LeLean, C.B., C.M.G., F.R.C.S.
Medicine—W. T. Ritchie, M.D.
Surgery—D. P. D. Wilkie, M.D., Ch.M.
Midwifery and Gynaecology—R. W. Johnstone, M.A., M.D.
Clinical Surgery—John Fraser, Ch.M., M.D.
Clinical Medicine—Edwin Bramwell, M.D., W. T. Ritchie, M.D., and D. Murray Lyon, M.D.
Tuberculosis—Sir Robert W. Philip, M.D.
Therapeutics—David Murray Lyon, M.D.
Psychiatry—George M. Robertson, M.D.

LECTURERS.

Anatomy—E. B. Jamieson, M.D., F. E. Jardine, M.B., W. O. Wood, Ch.M.
Applied Anatomy—F. E. Jardine, M.B.
Histology—May L. Cameron, M.A., B.Sc., M.B.
Biochemistry—Philip Eggleton, M.Sc., D.Sc.
Biophysics—W. A. Bain, B.Sc.
Physiology of the Nervous System—A. Ninian Bruce, M.D., D.Sc.
Materia Medica—C. M. Scott, M.B.
Pathology—Theodore Rettie, D.Sc., W. G. Millar, M.B.
Morbid Anatomy—J. Davidson, M.B.
Bacteriology—J. M. Alston, M.B., H. J. Gibson, M.B.
Physics—G. A. Carse, M.A., D.Sc., J. Paton, M.A., B.Sc.
Chemistry—Edgar Stedman, B.Sc., Ph.D., C. P. Stewart, M.Sc., Ph.D., Ellen Stedman, M.Sc.
Zoology—C. H. O'Donoghue, D.Sc., A.D. Hobson, M.A., A. L. Craig-Bennett, B.A.
Tropical Diseases—Lt.-Col. E. D. W. Greig, C.I.E., M.D.
Medical Entomology and Parasitology—J. H. Ashworth, D.Sc., F.R.S., A. E. Cameron, M.A., D.Sc., T. W. M. Cameron, D.Sc.
Tropical Hygiene—J. du P. Langrishe, D.S.O., M.B., B.Ch. (conjointly with Professor).
Public Health—John Guy, M.D.
Medicine—J. G. McCrie, M.B.
Surgery—J. J. M. Shaw, M.A., M.D.
Clinical Instruction in Infectious Fevers—Alexander James, M.D., W. T. Benson, M.D.
History of Medicine—J. D. Comrie, M.A., B.Sc., M.D.
Surgical Pathology—K. Paterson Brown, M.B.
Venereal Diseases—David Lees, D.S.O., M.B.
Psychology—J. Drever, M.A., B.Sc., D.Phil.
Radiology—J. Duncan White, M.B., D.M.R.E.
Neuro-Pathology—F. E. Reynolds, M.D.
Psychiatry—William McAlister, M.B.
Therapeutics—A. R. Gilchrist, M.B.
Mental Deficiency—R. D. Clark, B.Sc.
Orthopaedics—W. A. Cochrane, M.B.
Clinical Midwifery—R. W. Johnstone, M.D., James Young, M.D., H. S. Davidson, M.B., Douglas Miller, M.D., W. F. T. Haultain, M.B., E. C. Fahmy, M.B., John Sturrock, M.B., Clifford Kennedy, M.B.
Clinical Instruction in Diseases of Children—Charles McNeil, M.D., N. S. Carmichael, M.B., Ch.B., L. H. F. Thatcher, M.D., Gerda Herzfeld, M.B., and Norman Dott, M.B.

CLINICAL TEACHING STAFF, ROYAL INFIRMARY.

Clinical Surgery—Geo. L. Chiene, M.B., W. J. Stuart, M.B., J. W. Struthers, M.B., D. P. D. Wilkie, M.D., Ch.M., Henry Wade, M.D., John Fraser, M.D., Ch.M., J. M. Graham, Ch.M., A. Pirie Watson, Ch.M., F. E. Jardine, M.B., W. O. Wood, M.D., Ch.M., J. J. M. Shaw, M.D., Walter Mercer, M.B., W. A. Cochrane, M.B., K. Paterson Brown, M.B., R. Leslie Stewart, M.B., T. McW. Millar, M.B.

Clinical Medicine—D. Chalmers Watson, M.D., Edwin Bramwell, M.D., Edwin Matthew, M.D., W. T. Ritchie, M.D., John Eason, M.D., D. Murray Lyon, M.D., J. D. Comrie, M.D., Alex. Goodall, M.D., G. D. Mathewson, M.B., A. Fergus Hewat, M.D., H. L. Watson-Wemyss, M.D., W. D. D. Small, M.D., W. A. Alexander, M.D., T. R. R. Todd, M.D., A. R. Gilchrist, M.B., J. K. Slater, M.B.

Clinical Gynaecology—R. W. Johnstone, M.D., H. S. Davidson, M.B., James Young, M.D., W. F. T. Haultain, M.B., Douglas Miller, M.B., E. C. Fahmy, M.B.

Diseases of the Larynx, Ear, and Nose—John S. Fraser, M.B., J. G. Lithgow, M.B., W. T. Gardiner, M.B., G. Ewart Martin, M.B.

Diseases of the Skin—Fredk. Gardiner, M.D., R. Cranston Low, M.D., Robert Aitken, M.D., G. H. Percival, M.B., Ph.D.

Diseases of the Eye—A. H. H. Sinclair, M.D., H. M. Traquair, M.D., E. H. Cameron, M.B., C. W. Graham, M.B.

Practical Instruction is afforded, under the superintendence of the Professors, in Laboratories with the necessary appliances, and in Tutorial and Practical Classes connected with the above Chairs, and opportunities are afforded to Students to extend their practical knowledge and engage in original research.

Opportunities for Hospital Practice are afforded at the Royal Infirmary, the Hospital for Sick Children, Maternity Hospital, the City Fever Hospital, and the Royal Edinburgh Hospital for Mental Disorders. Upwards of 2,760 beds are available for the Clinical Instruction of Students of the University.

Four Degrees in Medicine and Surgery are conferred by the University of Edinburgh, viz., Bachelor of Medicine (M.B.), Bachelor of Surgery (Ch.B.), Doctor of Medicine (M.D.), and Master of Surgery (Ch.M.).

The minimum Class Fees for M.B. and Ch.B., including Hospital Fee (£12), amount to about £260, and the Matriculation and Examination Fees to £47 15s. 6d. An additional Fee of £21 is payable by those who proceed to M.D., and £21 by those who proceed to Ch.M.

The annual value of the Bursaries, Prizes, Scholarships, and Fellowships in the Faculty of Medicine amounts to about £3,600, and that of the other Bursaries, etc., tenable by Students of Medicine, amounts to about £1,820.

POST-GRADUATE INSTRUCTION.—Courses of instruction are given for the University Diplomas in Public Health, Tropical Medicine and Hygiene, Psychiatry, and Radiology. These Diplomas are open to approved registered practitioners as well as to graduates in Medicine and Surgery of the University. Courses of instruction for the Diploma in Tropical Veterinary Medicine are also given. This Diploma is open to those holding an approved Veterinary qualification registrable by the Royal College of Veterinary Surgeons. The University also takes part in the Courses given under the auspices of the Edinburgh Post-Graduate Courses in Medicine. In the departments of the Faculty of Medicine provision is made for research by students of graduate standing. In the University laboratories facilities will be provided for candidates for the Degree of Ph.D. whose applications to engage in research have been accepted by the Senatus.

A Syllabus and further information as to Matriculation, the Curricula of Study for Degrees, etc., may be obtained from the Dean of the Faculty of Medicine; and for Degrees in the Faculties of Arts, Science, Divinity, Law, and Music, from the Deans of these Faculties, or from the Secretary; and full details are given in the University Calendar, published by James Thin, 55, South Bridge, Edinburgh. Price, by post in June, 1931.

By authority of the Senatus, W. A. FLEMING, Secretary.

ROYAL COLLEGE of PHYSICIANS of EDINBURGH ROYAL COLLEGE of SURGEONS of EDINBURGH ROYAL FACULTY of PHYSICIANS and SURGEONS of GLASGOW.

Royal College of Physicians OF EDINBURGH.

The EXAMINATIONS for the LICENCE of the College (as a single qualification) for [illegible] year will be held on the *First Wednesday* and the following days of every month (except September and October).

Candidates for the LICENCE (as a single qualification) must send their names to the Secretary one week before the date of the Examination at which they propose to present themselves.

The EXAMINATIONS for the MEMBERSHIP of the College are held on the *Second Tuesday* and the following days of *January, April, July* and *October*.

Candidates for the MEMBERSHIP must submit their applications and testimonials to the Secretary one month before the date at which they wish to appear for Examination.

For the Regulations in regard to the above qualifications granted by the College, and all other information, application may be made to the Secretary.

F.R.C.S.(Edin.).

CLASSES, with Museum and Ward Demonstrations, for next Exam., will commence shortly. Correspondence work also. Particulars from CHAS. WHITTAKER, F.R.C.S., Surgeons' Hall, Edinburgh.

SCHOOL OF MEDICINE
OF
THE ROYAL COLLEGES, EDINBURGH.
(Founded 1505)

WINTER SESSION, 1931-32,
Opens 6th October.

The Lectures qualify for the English and Scottish Universities and other Medical Examining Boards.

One-half of the Qualifying Classes required for graduation in the University of Edinburgh may be attended in this School.

The School offers a large choice of Teachers upon the various subjects comprised in the Medical Curriculum.

The Calendar of the School, giving all necessary information regarding Classes, Fees, and Examinations, will be published on September 2nd; a copy may be obtained (price 6d.) on application to the DEAN OF THE SCHOOL, Surgeons' Hall, Edinburgh.

UNIVERSITY OF ST. ANDREWS
(SCOTLAND)

Chancellor: The Rt. Hon. STANLEY BALDWIN, M.P., P.C., LL.D.
Rector: Sir WILFRED THOMASON GRENFELL, K.C.M.G., M.D., LL.D., F.R.C.S.
Vice-Chancellor and Principal: Sir JAMES COLQUHOUN IRVINE, C.B.E., D.Sc., I.L.D., Sc.D., F.R.S.

FACULTY OF MEDICINE.
Dean: Professor FRANCIS JAMES CHARTERIS, M.D.

The University confers the following DEGREES AND DIPLOMAS: M.B., Ch.B., M.D., Ch.M., Ph.D., D.P.H., L.D.S., D.P.D. (all open to men or women).

SESSION 1931-32 opens October 9th, 1931. The whole curriculum may be taken at Dundee, or the first two years may be taken in St. Andrews, the remaining three in Dundee.

CLINICAL INSTRUCTION at Dundee Royal Infirmary, Dundee Dental Hospital, and other Medical and Surgical Institutions in Dundee.

BURSARY (Scholarship) Competitions. June annually. Entries due May 9th.

BURSARIES FOR MEDICAL STUDENTS.—At St. Andrews: Taylour Thomson (for women), 1 of £40 and 1 of £30 for 5 years; Malcolm (for men and women), £40 for 5 years, vacant annually. At Dundee: Hepburn (for men or women), £25 for one year, vacant annually.

BURSARIES FOR WHICH MEDICAL STUDENTS ARE ELIGIBLE.—At St. Andrews: About 14 Bursaries ranging in value from £50 to £10, tenable for 3 or 4 years (6 for men or women, 7 for men only, 1 for women only), vacant annually. At Dundee: About 8 Bursaries from £50 to £40, for 4 years.

RESIDENTIAL ENTRANCE SCHOLARSHIPS FOR MEN.—At St. Andrews: Five or six of £100 competed for annually in June. Medical students are eligible.

FEES for complete M.B., Ch.B. Course, exclusive of Examination Fees, Hospital Fees, etc., £182.

PRELIMINARY EXAMINATION.—September and March. Entries due August 11th and February 9th.

PRE-REGISTRATION EXAMINATION (Physics and Chemistry).—September, December, and June. Entries due August 31st, November 4th, May 2nd.

RESIDENCE HALLS for Men and Women at St. Andrews; for Women at Dundee.

Provision made for POST GRADUATE STUDY AND RESEARCH.

Full information may be got from the Secretary of the University, 71, North Street, St. Andrews, or the Dean of the Faculty of Medicine, Westlands, St. Andrews.

THE ROYAL DENTAL HOSPITAL OF LONDON SCHOOL OF DENTAL SURGERY
(University of London),
Leicester Square, London, W.C.

SESSIONS COMMENCE OCTOBER and MAY.

Students are admitted for the curriculum for the B.D.S. Degree and the L.D.S. Diploma.

DENTAL MECHANICS

Pupils may join at the commencement of either the May or October Sessions for the training in Dental Mechanics specified in the curriculum.

HOSPITAL PRACTICE.

The School is thoroughly equipped. The Clinic of the Hospital is unrivalled.

POST GRADUATE INSTRUCTION.

Classes can be arranged for Post Graduate instruction in all branches of Dental Surgery. Write for further particulars and School Calendar to the DEAN as above.

THE WELSH NATIONAL SCHOOL OF MEDICINE.

The next Session will open on October 1st. The Courses of Instruction are open to both men and women students and qualify for the Degrees in Medicine and Surgery of the University of Wales and for the Degrees and Diplomas of other Examining Bodies. Hospital Instruction is given at the Cardiff Royal Infirmary, at the City Lodge Hospital, and at other recognised Institutions. Full facilities are available for every branch of study.

Medical Practitioners wishing to prepare for the Diploma in Public Health or for the Tuberculous Diseases Diploma of the University of Wales can attend complete courses of instruction in the School.

Prospectuses can be obtained on application to the Secretary, Welsh National School of Medicine, The Parade, Cardiff.

SOCIETY OF APOTHECARIES OF LONDON

MASTERY OF MIDWIFERY.

Examinations will be held beginning Monday, November 16th, 1931, and Tuesday, May 17th, 1932.

For regulations, apply to the Registrar, Water Lane, E.C.4.

POST-GRADUATE MIDWIFERY.

Qualified Medical Women are admitted to

The Mothers' Hospital of the Salvation Army, Lower Clapton Road, E.5

for practical fortnightly Courses in Midwifery. These include delivery of normal cases, attendances at all abnormal cases, operations, ward rounds of visiting staff, V.D. clinics, and ante-natal clinics. For further particulars, fees, etc., apply to EDGAR DIBDEN, the Secretary.

ALL MEDICAL EXAMINATIONS

Are you preparing for any MEDICAL or SURGICAL EXAMINATION?

Do you wish to coach in any branch of Medicine or Surgery?

"Guide to Medical Examinations."

Principal Contents:

The Examinations of the Conjoint Board.
The M.B. and M.D. Degrees of all British Universities.
How to pass the F.R.C.S. Exam.
The M.S.Lond. and other Higher Surgical Examinations.
The M.R.C.P.
The D.P.H. and how to obtain it.
The Diploma in Tropical Medicine.
The Diploma in Psychological Medicine.
The Diploma in Ophthalmology.
The Diploma in Laryngology and Otology.
The Diploma in Radiology.
The L.D.S. and all Dental Exams.

¶ The activities of the Medical Correspondence College cover every department of Medical, Surgical, and Dental tuition.
¶ Desultory reading is wasteful for examination purposes.
¶ The secret of success at examinations is to concentrate on essentials.
¶ First attempt success at examinations is the sole aim of our courses
¶ Concentration on the exact requirements is assured by our intensive Revision Courses.
¶ The intensive postal, oral, clinical, and practical courses of the College in every subject are always in progress and meet every requirement.

Post-graduate coaching for all the higher examinations, and hospital attendance arranged in any special department of medicine or surgery.

We can satisfy every requirement. Send for your copy now!

Streatfeild Research Scholarship
IN MEDICINE AND SURGERY.

In accordance with the Trust founded by Mrs. Eliza Streatfeild for the promotion of Research in Medicine and Surgery, a Committee of the Royal College of Physicians of London and of the Royal College of Surgeons of England will proceed (in October) to appoint a Streatfeild Research Scholar.

The emolument will probably be £250 per annum, and the tenure of the Scholarship three years, at the discretion of the Committee.

A form stating the nature of the particulars which each candidate is required to give may be obtained from the Registrar, Royal College of Physicians, Pall Mall East, S.W.1.

Applications should reach the Registrar not later than Wednesday, September 23rd. The envelope should be marked "Streatfeild Scholarship."

Royal Infirmary, Edinburgh.

In this Hospital (with 1,011 beds) Clinical Instruction is given by the Honorary Staff of Physicians and Surgeons to Male and Female Students. Special Instruction is given in the Medical Department on the Diseases of Women, Physical Diagnosis, Diseases of the Skin, and Radiology; and in the Surgical Department on Diseases of the Eye, the Ear and the Larynx, and in Dental Surgery. Separate Departments and Wards are devoted to Venereal Diseases, Diseases of Women, Diseases of the Eye, the Ear and the Throat, the Skin, and Radiology; also to Cases of Incidental Delirium or Insanity. Post-mortem Examinations are conducted in the Anatomical Theatre by the Pathologist, who also gives Practical Instruction in Pathological Anatomy and Histology.

APPOINTMENTS.

No fees are charged for any Medical or Surgical Appointments in this Hospital, which are as follows:

1. Resident Physicians and Surgeons, who must be registered as legally qualified Practitioners, are from time to time appointed by the Managers on the recommendation of the Physicians and Surgeons. The holders of these offices live in the house free of charge. The appointment is for six months, but may be renewed at the end of that period by recommendation.

2. Non-resident House Physicians and Surgeons and Clinical Assistants, who must be registered as legally qualified Practitioners, are appointed by the Managers on the recommendation of the Physicians and Surgeons. The appointment is on the same terms as that of the Resident Physicians and Surgeons.

3. Clerks and Dressers are appointed by the Physicians and Surgeons. These appointments are open to all Students and Junior Practitioners holding Hospital Tickets.

Assistants in the Pathological Department are appointed on the recommendation of the Pathologist.

HENRY MAW,
Secretary & Treasurer.

County Borough of Blackburn

ASSISTANT SCHOOL MEDICAL OFFICER and ASSISTANT MEDICAL OFFICER OF HEALTH.

Applications are invited from registered Medical Practitioners for the post of Assistant School Medical Officer and Assistant Medical Officer of Health (male) to act under the supervision of the Medical Officer of Health, who is also the School Medical Officer.

The person appointed must devote the whole of his time to the service of the Corporation.

The duties of the office will consist largely, but not exclusively, of work in the School Medical Department, and a Knowledge of these duties is essential. Preference will be given to candidates with a Diploma in Public Health and having experience in Infectious Diseases.

The salary will be £600 per annum, to be increased by annual increments of £50 to a maximum of £700 per annum.

Forms of application and further particulars of the duties and conditions of the appointment may be obtained from the Medical Officer of Health, Victoria Street, Blackburn.

Completed forms, accompanied by copies of three recent testimonials, must reach me by Wednesday, September 9th, and should be endorsed on the envelope "Assistant School Medical Officer."

Canvassing will disqualify.

BRIGGS H. MARSDEN,
Town Clerk.

Town Hall, Blackburn.
August 25th, 1931.

Hampshire County Council.

ASSISTANT COUNTY MEDICAL OFFICER.

Applications are invited for the post of Assistant County Medical Officer. Preference will be given to candidates who possess a Diploma or Degree in Public Health, but experience, and previous experience in Tuberculosis work is desirable. Experience in other departments of Public Health work, including Supervision of School Children, Maternity and Child Welfare, and Venereal Diseases, will be considered an advantage.

Salary £600 a year, rising by annual increments of £25 to £750 (subject to deductions under the Local Government and Other Officers' Superannuation Act, 1922). In addition, travelling expenses and subsistence allowance.

When the County Districts Area has been organized, there may be an opportunity of securing a better appointment at increased remuneration.

Applications, with copies of not more than three recent testimonials, upon a form to be obtained from the County Medical Officer of Health, Castle, Winchester, should be sent to him as soon as possible, and not later than the 12th. Canvassing is prohibited.

THE MEDICAL AND DENTAL DEFENCE UNION OF SCOTLAND, LIMITED.

Secretaries and Registered Office: Millar, Thomson & Dunlop, C.A., 113, St. Vincent Street, Glasgow.

ANNUAL SUBSCRIPTION £1. ENTRANCE FEE 10/-.

No entrance fee to those joining within 12 months of obtaining qualification. Benefits include defence of claims for alleged negligence in professional work, including indemnity of £2,500 and costs, and advice on professional difficulties.

Particulars and forms of application can be obtained from the Secretaries at the above address.

Corporation of Kingston-upon-Hull and the Hull and Goole Port Sanitary Authority.

ASSISTANT MEDICAL OFFICER OF HEALTH.

The Corporation of Kingston upon Hull and the Hull and Goole Port Sanitary Authority invite applications for the appointment of a male Assistant Medical Officer of Health, at a salary of £600 per annum, rising by annual increments of £25 to £700 per annum.

Applicants must be registered Medical Practitioners, under 40 years of age, and must hold a registered degree or diploma in Public Health or State Medicine.

The person appointed will be engaged primarily on routine Port Sanitary Work, Medical Inspection of Aliens, Bacteriological Work, and the control of Infectious Diseases, but may be called upon to do work in any other department of the Public Health Services, in accordance with the Corporation's scheme for the interchange of medical staff.

Experience in Port Sanitary Work and Infectious Diseases will be considered as important qualifications for the appointment.

The candidate appointed will be required to devote the whole of his time to the duties of the office, and also to contribute at the rate of 5 per cent of his salary to a superannuation fund under the Local Government and Other Officers Superannuation Act, 1922.

Forms of application and further particulars of the duties and conditions of service can be obtained from the Medical Officer of Health, Guildhall, Hull.

Applications, endorsed "Assistant Medical Officer of Health," together with copies of three recent testimonials, must reach the above-mentioned not later than the first post on Monday, September 14th

Guildhall, J. R. HOWARD ROBERTS,
Hull 1931. Town Clerk.

City of Leeds.

CHIEF ASSISTANT MEDICAL OFFICER OF HEALTH.

Applications are invited from qualified and registered Medical Practitioners for the post of Chief Assistant Medical Officer of Health for the City of Leeds Candidates must not be more than 40 years of age and, in addition to previous experience in Public Health administration, should also have had experience in one or more of the special branches of Preventive Medicine—e.g., School Medical Work, Tuberculosis, Maternity and Child Welfare, etc

The person selected will be required to devote his whole time to the office, and to perform such duties as are allotted to him by the Medical Officer of Health It will be necessary for him to enter into an agreement of service with the Corporation, terminable by three months' notice on either side, and to pass a medical examination, and contribute to the Superannuation Fund established under the Local Government and Other Officers Superannuation Act, 1922

The salary will be £900 per annum Applications, stating age, qualifications, and experience, together with copies of three recent testimonials, endorsed "Chief Assistant Medical Officer," must be delivered at my office, 26, Great George Street, Leeds, not later than 10 a.m on Thursday, September 10th

British Medical Bureau

(THE SCHOLASTIC, CLERICAL & MEDICAL ASSOCIATION LTD.)
(FOUNDED 1880)

12, Stratford Place,
Oxford Street, W.1.

Tele. Address: Triform, Wesdo—London. Telephone: Mayfair {1783 1783

The Association has long been favourably known to the members of the Medical Profession as a thoroughly trustworthy and successful Agency for the transaction of every description of Medical, Scholastic and Accountancy business, and the BRITISH MEDICAL ASSOCIATION have every confidence in recommending its members to consult MR. A. V. STOREY, the General Manager, in all transactions requiring the services of a Medical Agent.

Members of the British Medical Association may take advantage of a reduced scale of charges applicable to them.

The business undertaken by the British Medical Bureau is divided under the following heads:—

TRANSFER OF PRACTICES, PARTNERSHIPS, etc.

Medical Practitioners wishing to dispose of Practices, or desiring to take Partners, are advised to negotiate the business through the British Medical Bureau. Vendors may depend upon receiving introductions only to eligible and bona-fide purchasers. All information is treated in strictest confidence. Full and trustworthy information regarding Practices, Partnerships, etc., for disposal, supplied gratis to Purchasers.

ASSISTANTS AND LOCUM TENENS.

Assistants and Locum Tenens can be secured at short notice. It is the foremost aim of the British Medical Bureau to ensure that only the most Trustworthy and Reliable Locums and Assistants are sent out

RESIDENT PATIENTS.

Medical Men wishing to receive Resident Patients should enrol their names on the books of the British Medical Bureau. A large number of Patients are placed yearly through this medium.

ACCOUNTANCY.

The British Medical Bureau has its own staff of qualified Accountants wholly engaged on medical work i.e., Investigation of Practices for purchasers, Income Tax, Auditing Accounts, etc.

—THAT ENDS WELL

YOUR patient begins with a tablespoonful  continues with a teaspoonful  and finally stops it altogether  Surely, there is no clearer way to demonstrate  the therapeutic value of AGAROL  in the treatment of constipation.

Besides, Agarol Brand Compound is so easy to take. No oiliness, no artificial flavouring to get used to. It can be mixed with water, fruit juices, milk, with semi-solid food, used as a salad dressing in place of mayonnaise. Serves you better—serves your patient better.

AGAROL Brand Compound is the original mineral oil and agar-agar emulsion with phenolphthalein. It softens the intestinal contents and gently stimulates peristalsis.

A supply gladly sent for trial.

AGAROL *for Constipation*

BRAND COMPOUND

VACCINES

For Prophylaxis

Against Respiratory Infections

PROPHYLACTIC inoculation against the common "cold", influenza and catarrhal conditions of the respiratory tract generally has given a high degree of immunity in a large number of cases.

¶ The micro-organisms most commonly found in patients suffering from "colds" are Pneumococcus, Pfeiffer's Bacillus, *Micrococcus catarrhalis* and *Bacillus Septus* and these are included in the ANTI-CATARRH VACCINE prepared in the Department for Therapeutic Inoculation, St. Mary's Hospital, London, W., especially for the prophylaxis of colds in adults. The prophylactic effect of this vaccine is most advantageously obtained if inoculations are carried out during the latter part of September or early in October.

¶ It is generally agreed that the serious and sometimes fatal complications of influenza—such as bronchitis and pneumonia—as well as many of the less severe symptoms, are caused by infection with Pfeiffer's Bacillus, Pneumococcus and Streptococcus. On this account the ANTI-INFLUENZA VACCINE (MIXED), St. Mary's Hospital Formula, which contains these three organisms, is of great value as a prophylactic of influenza.

¶ In connection with whooping-cough, very successful results have attended the use of vaccines prepared from the Bordet-Gengou bacillus. For prophylactic purposes two vaccines are offered, viz:—WHOOPING COUGH VACCINE A, which contains Bordet's bacillus alone; and WHOOPING COUGH VACCINE B, which contains Pneumococcus and Pfeiffer's bacillus in addition, and thus aims at protecting against complications due to these secondary invaders.

Further particulars of the above vaccines (which are prepared in the Department for Therapeutic Inoculation, St. Mary's Hospital, London, W., under the direction of Sir Almroth E. Wright, M.D.) will be supplied on request.

3 Volumes and Index

GRAHAM'S SURGICAL DIAGNOSIS

Now Complete

By a painstaking discussion of differential diagnosis, misleading signs and symptoms are explained and the many clinical presentations of a disease or condition are set out in sharp outline. Indeed, this clinical tone is immediately perceived upon opening the work and springs from the practical experience of the authors. Bedside and laboratory methods are described, the guiding idea throughout being to help you make your diagnoses more accurate, less presumptive. But Dr. Graham does not stop here; he includes full consideration of the diagnoses of post-operative complications—those dangerous sequelae which are frequently dismissed briefly in the usual book on surgery. There are 1,275 Illustrations.

"Altogether this work can be very heartily recommended since it presents the state of modern surgical knowledge in a very fair and unbiased manner; it will especially appeal to those who believe that surgery is a science as well as an art."—BRITISH MEDICAL JOURNAL.

Three octavo volumes totalling 2,750 pages, with 1,275 Illustrations and a separate Desk Index Volume. By 43 American authors. Edited by EVARTS A. GRAHAM, M.D., Bixby Professor of Surgery, Washington University, St. Louis. Per set Cloth, £7 10s net

A New Work

BECKMAN'S TREATMENT

Recently Issued

This new book contains a great store of new treatment—*clinically* applied. There are dozens and dozens of prescriptions, fully written out with quantities and advice on their administration. Prominent consideration is given to dietetics, frequently including complete diet lists. Proper emphasis is placed on the modern application of disease prevention. This is a book of experience—the kind of treatment the physician in general practice is daily called upon to administer.

"This book or its equivalent should be in the hands of every physician, and we have not yet come across its equivalent."—THE LANCET.

Octavo volume of 899 pages. By HARRY BECKMAN, M.D., Professor of Pharmacology, at Marquette University, Milwaukee. Cloth, 45s net.

Recently Issued

CHRISTOPHER'S MINOR SURGERY

A Great Book

Here is a book you can follow absolutely in your practice. Full technique is given, every step being set down to guide you. Instruments and their manipulations are described and illustrated, complications are foreseen and their treatment provided for. The methods presented are varied so as to enable you to fit the treatment to the individual case. It is one of the finest books we have ever published; and certainly no more practical work on Minor Surgery can be found.

"This is a very good book. Its arrangement follows the usual lines except for the welcome addition of a long chapter designed for 'The Surgical Intern.' This is full of sound advice which may be read with profit not only by the house surgeon, but also by his chief, and is mostly applicable to residents in our own hospitals. The book is admirably printed on excellent paper, and the illustrations are superb. The consulting surgeon and the practitioner will find much to interest them, while the house surgeon will find it invaluable."—THE LANCET

Octavo volume of 694 pages, with over 600 Illustrations on 465 figures. By FREDERICK CHRISTOPHER, M.D., F.A.C.S., Associate in Surgery, Northwestern University Medical School, Chicago. With a Foreword by ALLEN B. KANAVEL, M.D., F.A.C.S., Professor of Surgery, Northwestern University Medical School. Cloth, 36s net.

Recently Issued

CAMPBELL'S ORTHOPEDIC SURGERY

Recently Issued

Dr. Campbell robs orthopedic surgery of many of its traditional difficulties. Moreover, he has included in his presentation of the subject *Fractures and Dislocations* because of their frequent occurrence in general practice. *The Diagnosis* of orthopedic conditions receives unusual consideration. A special chapter is given over to *orthopedic examination*. *Treatment* is presented with rare clarity and simplicity. Every form of treatment which gives promise of result is included—heliotherapy, actinotherapy, marine treatment, exercises, and other non-operative methods as well as operative technique.

"The book can be recommended with confidence to the general surgeon, as well as to the specialist who is called upon to treat such affections. It is nicely illustrated, and many radiograms are reproduced. The general production of the volume—binding, print, etc.—is excellent, and we foretell for it every success."
—IRISH JOURNAL OF MEDICAL SCIENCE

Octavo of 705 pages, with 507 Illustrations. By WILLIS C. CAMPBELL, M.D., F.A.C.S., Professor of Orthopedic Surgery, University of Tennessee. Cloth, 37s 6d net.

Fourth Edition

NORRIS & LANDIS—CHEST AND DIAGNOSIS

Recently Issued

Reviewing the new (fourth) edition of this standard book, *The Irish Journal of Medical Science* says: "The reason why *Diseases of the Chest* is so useful and popular is not hard to find. It is because it is built up on a basis of physics and pathology, and because it is so thoroughly illustrated . . . The book was originally planned and written for the clinician, and subsequently slight alterations have rather enhanced its usefulness for him. It is, we believe, the best book of its kind."

Diseases of the Chest and Physical Diagnosis. By GEORGE W. NORRIS, M.D., Professor of Clinical Medicine at the University of Pennsylvania; and H. R. M. LANDIS, M.D., Sc.D., Director of the Clinical and Sociological Departments of the Henry Phipps Institute, University of Pennsylvania. With a chapter on the *Electrocardiograph in Heart Disease* by EDWARD B. KRUMBHAAR, M.D., Director of Laboratories of the Philadelphia General Hospital. Octavo of 954 pages, with 478 Illustrations, some in colour. Cloth, 45s net.

ANTI-TYPHOID-PARATYPHOID (T.A.B.) ORAL VACCINE

Administration of this protective vaccine by mouth is now an established alternative to the usual hypodermic method for immunisation against the enteric diseases, and has the advantage of avoiding all reaction.

This method is especially indicated where rapid immunisation is desired, as in the case of contacts; or when facilities for hypodermic injection are lacking.

Issued in packages containing three doses of killed emulsion, with three bile tablets for oral administration on three successive mornings. Full instructions accompany the package. Price 17/6 per set.

THE DENVER CHEMICAL MFG. COMPANY, LONDON, E. 3

Inc. in U.S.A. with limited liability

Belts by Roussel combine Hygienic Figure Control with Beauty of Form

LONG-BELT.

Prices: In strong thread elastic, £4 4s.; in firm and supple thread and silk elastic, £5 15s.; in extra fine and supple elastic, all pure silk, £9 9s. Hip belts 13" deep and upwards from 30s. Post free in U.K.

Designed on strictly anatomical lines by the famous Paris corsetier, Roussel Belts combine the advantages of a medical appliance with those of a beautiful figure.

Doctors are agreed that recent fashions, demanding little bodily support, have been the cause of troubles such as obesity, sagging abdominal muscles, enteroptosis and gastroptosis. Some support is needed, and many of the Medical Profession now recommend the Roussel Belt. It is a definite step forward in modern Belt construction and is to be advised particularly for post-operation and maternity wear.

Woven to individual measurements, in a special light porous elastic which maintains a continuous massaging action while in wear, Roussel Belts are ideal for women who wish to have healthy and beautiful bodies.

Because complete satisfaction is dependent upon perfect fitting, Belts by Roussel are sold only through Roussel Salons as listed below.

6 King Street Manchester

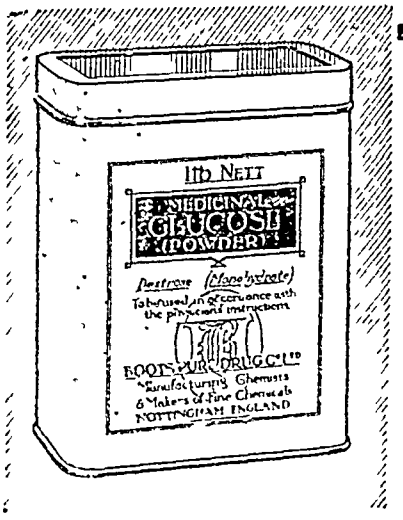
A reduction of 4s. in the £ is made on purchases for personal use by all members of the Medical Profession

In Convalescence

"A comparison of the rapidity of convalescence and the gain in nutrition, in colour, in weight, in strength and in nervous stability between the patients similarly operated upon, who had not received Sanatogen and those who had, leads me to believe that it proved an important factor in bringing about the rapid recovery of the last mentioned class of cases.



It evidently caused a better utilization of the other food materials and stimulated the appetite, thus increasing the efficiency of the diet as a whole. It was well-borne and retained at a stage, when digestive functions were almost entirely paralysed."

(Extract from the "International Journal of Surgery," Vol. 21, No. 7)

A safe and simple antacid which is also a gentle laxative must necessarily be of great value to medical practitioners when administering to ladies and children and all who are constitutionally delicate.

May we, therefore, venture to remind you of

DINNEFORD'S PURE FLUID MAGNESIA

which has been extensively prescribed and used by the Medical Profession for a Century, and is still the best and safest means of administering Magnesia.

When prescribed for the nursery, too, Dinneford's Magnesia has always proved immensely useful as a corrective, and when mixed with infant's food it prevents many of the troubles which are due to acidity, flatulence, etc.

We are confident that you will find in Dinneford's Fluid Magnesia a reliable and safe solution which may be freely used for many ailments, and we would request your kind consideration of its use as occasion offers.

Dinneford's Pure Fluid Magnesia possesses antacid and laxative qualities which are incomparably better than those of any of the various preparations of Magnesia, in powder, now being introduced.
It cannot harm the most delicate constitution and is at all times a safe and effective laxative.
Manufactured in London for the past 100 years.

DINNEFORD & Co. LTD.

Break the vicious circle

DEMINERALIZATION · CACHEXIA · UNDERNUTRITION · ANEMIA · DEMINERALIZATION

Insufficiency of the essential minerals—sodium, potassium, calcium, iron and manganese—inevitably leads to syndromes of lowered vitality.

In cases of neurasthenia, debility, anemia, cachexia, weak resistance and other run-down conditions, Compound Syrup of Hypophosphites "Fellows" supplies these indispensable minerals in assimilable form, in conjunction with phosphorus, quinine and strychnine.

An Improved form of Treatment for Digestive Disorders

"Alocol" is the practitioner's safeguard when alkaline medication is required. Its clearly defined antacid properties exceed those of bicarbonate of soda, magnesia and subnitrate of bismuth; furthermore, "Alocol" eliminates all the unpleasant drawbacks which are particularly feared with the usual alkalis and oxides.

When "Alocol" reaches the stomach adsorption takes place; a colloidal jelly is formed which, adhering to the walls of the stomach, diminishes their sensibility. The excess of hydrochloric acid is absorbed, but the acid reaction necessary for peptic digestion remains normal.

"Alocol" is highly recommended for use in all cases of hyperacidity, against which it is a specific. It is also indicated in the more serious manifestations, such as gastrectasis, gastrelcosis, pyloric and duodenal ulcers, etc.

Complete chemical history of "Alocol," with convincing clinical reports and supply for trial, sent free to physicians on request.

A. WANDER, Ltd., Manufacturing Chemists, 184, Queen's Gate, London, S.W.7

Works: KING'S LANGLEY, HERTFORDSHIRE

ALOCOL

Colloidal Hydroxide of Aluminium

A Distinct Advance Over Preparations of Acetyl-Salicylic Acid

Acetyl-salicylic acid possesses a notable disadvantage. Physicians have proved that it cannot be tolerated by patients suffering with a delicate stomach. Consequently, the value of this medicament in the wide field in which it is indicated is very seriously reduced.

"Alasil" completely overcomes this objection. By combining calcium acetyl-salicylate with "Alocol," unfavourable secondary action upon the stomach is prevented. This beneficial influence is undoubtedly due to the presence of "Alocol" (Colloidol Hydroxide of Aluminium), which preparation has brilliantly stood the test of practice in the treatment of hyperacidity and other ill conditions of the gastric tract. "Alasil" is therefore a triumph over acetyl-salicylic acid. It enables higher doses to be administered and maintains the patient's system under its influence for a greater length of time. Analgesic, Antipyretic, and Sedative. "Alasil" is indicated in all cases where acetyl-salicylic acid has been used heretofore.

A supply for clinical trial with full descriptive literature sent free on request.

A. WANDER, Ltd., Manufacturing Chemists,
184, Queen's Gate, London, S.W.7.

Jaundice in Childhood

In a discussion which took place at the recent meeting of the British Medical Association (*B.M.J.*, 1931, 2, 204) attention was directed to the value of intravenous injections of glucose in the treatment of jaundice in childhood, one member stating that the results obtained rom glucose injections in the terror-stricken condition accompanying cholaemia led him to try similar treatment for night-terrors, for which condition also glucose administration has now become the routine treatment.

For intravenous administration the employment of a pure form of glucose is of vital importance.

Medicinal Glucose B.D.H. is a pure chemical substance prepared specially for administration by intravenous injection.

It is Wise to Add "Wright's" when prescribing "Liquor Carbonis Detergens"

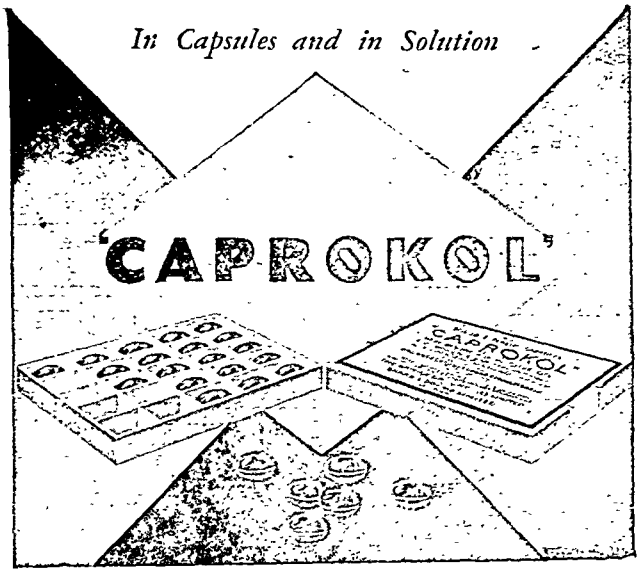
Although there is no secrecy as to the composition of *Liquor Carbonis Detergens* (it is described as "an alcoholic solution of coal tar"), the method of manufacture is unique. Imitations will be found to be produced by simple digestion, usually accompanied by some primitive, perfunctory and inadequate stirring; whereas, in the case of the genuine product, the intimate contact required for the complete extraction of all the soluble antiseptic constituents is attained by a series of complicated processes, involving the use of highly specialized machinery.

On receipt of your professional card, a package will be sent containing a sample of each of the following—

Wright's Coal Tar Soap.
Wright's Coal Tar Ointment.
Wright's Lysol.
Wright's Liquor Carbonis Detergens.

WRIGHT, LAYMAN & UMNEY LTD., 66, PARK STREET, SOUTHWARK, S.E.1.

'CAPROKOL'



Brand of Hexylresorcinol

For oral administration in the treatment of infections of the Urinary Tract

The immediate result of 'Caprokol' therapy is the establishment of a condition of ease and comfort; continued treatment results, in the majority of cases, in complete sterilisation of the urinary system.

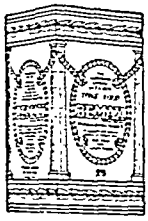
Has the Ordinary Diet Sufficient Vitamin B?

At the request of many correspondents a series of tests were recently conducted at the Bemax laboratories to determine how far the ordinary daily diet is an adequate source of Vitamin B.

The diet chosen for the tests included Eggs, Bacon, Bread, Butter, Beefsteak, Cabbage, Potatoes, Cheese, and a suitable percentage of A and D Vitamin.



The results prove conclusively that such a diet is in fact deficient in B Vitamin and cannot, by itself, meet the nutritional requirements of adults or promote normal growth in children.

Ample evidence is already available to show that partial B Vitamin deficiency results in a progressive deterioration of the digestive system, and may well be the principal cause of the many intestinal complaints which are so common to-day.

Bemax provides an ideal way of supplementing the ordinary diet with an adequate supply of B Vitamin, of which it is the richest known source in B, Bii, and Biii.

Its value as a tonic restorative food can hardly be over-estimated and its use has been attended with striking results in Dyspepsia, Constipation, Sleeplessness, Nervous Debility, Rheumatism, and all B deficiency diseases. As its content of E Vitamin is also exceptionally high it can be used with great advantage in the treatment of Sterility.

Medical Men are invited to write for reports of the tests referred to in this advertisement.

Laboratory Reports on Bemax and Clinical Sample for personal trial will be sent to any Medical Man on request.

ALIMENTARY TOXAEMIAS

PUTREFACTIVE bacteria increase in numbers in the intestine as age advances. They are relatively scanty in the young child, but after middle life are usually present in considerable numbers. Of the micro-organisms concerned, proteolytic anærobes are probably the most important.

In individuals with a normal intestine and free evacuations, they may do little harm, but in those subject to intestinal catarrh, these putrefactive bacteria become more numerous and active, their products are formed in greater quantity, and are more freely absorbed, and the condition of alimentary toxæmia results. The manifestations of this state are very protean, *e.g.*, "rheumatic" conditions, digestive upset, neurasthenia and neuralgias, increased blood pressure and its complications, and many others. The treatment, in the first place, obviously should be *intestinal disinfection*. For this purpose nothing surpasses the use of KEROL CAPSULES. They have solved for years the question of disinfection of the alimentary tract. They definitely reduce the bacterial content of the intestine, as shown by the reduction in *B. coli* by 99% when the capsules are regularly administered for a period of from seven to ten days. We have from time to time published several booklets containing clinical evidence as to their value, and these we will gladly forward, on receipt of a postcard, to any member of the Medical Profession.

Benger's Food—*the adjustable diet.*

The "LANCET" describes it as "Mr. Benger's admirable preparation."

Owing to the presence of the natural enzymes of digestion (*Amylopsin* and *Trypsin*), and its method of preparation for a patient, the extent of self-digestion of Benger's Food and the milk with which it is mixed *can be regulated to suit the digestive powers of the patient.*

Benger's Food is prepared with fresh cows' milk. It forms a dainty cream which becomes the easier of digestion the longer it is allowed to stand after mixing. The process may be arrested at any time by simply bringing the mixture to the boil. (A useful average time for standing is 15 minutes).

Patients ordinarily unable to digest milk can take this mixture satisfactorily, as the Benger's food so softens the casein that when under the influence of the gastric juice it forms into minute flocculi instead of a heavy curd.

Benger's Food is of the highest nutrient value and is not found to pall, even when taken over long periods.

A Physician's Sample will be sent post free to any member of the Medical Profession making application to the Proprietors—

BENGER'S Food

Food Poisoning—
The Kaylene Treatment

The following letter has been received.

Messrs. KAYLENE, LTD.

DEAR SIRS,

I am in receipt of your sample of Kaylene, for which I thank you. I do not dispense and do not wish to be without some in the house.

My last sample was used on a patient suffering from acute Ptomaine poisoning following a meal of shell fish (mussel) at 10.30 p.m. Symptoms first appeared at 12.30 a.m., and when I saw him at 3 a.m. he was vomiting blood and passing almost pure blood per rectum. He had commenced cramps and nervous twitchings which would shortly have gone on to tonic convulsions. He was very collapsed and had a weak pulse. I gave him **only** Kaylene in cold water, one drachm every quarter of an hour, from 3.0 until 8 a.m., when I felt it safe to leave him. For the next two days Kaylene was given every one to two hours, and was then followed by Kaylene-ol. No other medication of any sort was used, and he made an excellent recovery. This follows a somewhat similar case which I treated at the end of last year.

Your excellent preparation should supplant Bismuth for any purpose.

Yours faithfully,

Physician to————. ————, M.B.

STANIFORM

Regd. BRAND. Trade Mark.

METHYL STANNIC IODIDE

OINTMENT
Immediately stops the pain in all cases of burns, scalds, etc.

DUSTING POWDER
For application where a greasy substance is contra-indicated.

LINIMENT
Remarkably effective in treatment of Rheumatoid Arthritis.

LOTION
A panacea for Mosquito and other insect bites. Most effective for all purposes where *Tr. Iodine* is employed. Does not stain the skin and there is no sting.

TABLETS
Staniform being an organic compound is more easily assimilated than the Tin preparations at present in use.

Supplies may be obtained through the Wholesale Druggists, Druggists' Sundriesmen, or Dental Supply Companies.

What the Profession says

The following are two recent unsolicited testimonials reported to the Manufacturers by Medical Men.

"After using 'Staniform' Ointment in cases of Impetigo and other septic conditions of the skin, I was much impressed by the rapid response to treatment. Also herpes on the lip quickly disappeared after application of 'Staniform' Ointment."

"Festering wound on left heel—when first seen was about the size of a shilling, with a good deal of pus. Foot much swollen—dressed with 'Staniform' Ointment—healed splendidly in four days."

Similar testimony has been received from a large number of medical men when "Staniform" has been used for the treatment of Burns, Wounds, and Skin Ailments

STANIFORM is used in Leading Hospitals.

STANIFORM over a wide field of clinical experience has exhibited positive curative properties. Combining the well-known usefulness of Tin in staphylococcic infections with the powerful germicidal properties of Iodine, *Staniform* is indicated generally in local inflammations, inducing an immediate soothing effect with rapid healing.

STANIFORM LTD., CARNWATH ROAD, LONDON, S.W.6

NUTRITIONAL ANÆMIA IN INFANCY

The investigations into the nutritional anæmia of Infancy have been brought to a successful conclusion, and the results fully reported in the Medical Research Council Report (Special Report Series No. 157) 1931.

The milk food used in this extensive work is now available to Medical Practitioners under the name of

HĒMOLAC

(Full Cream Milk Powder with Iron Ammonium Citrate)

The exhibition of Hēmolac rapidly restores the hæmoglobin percentage of anæmic infants to a normal figure. It has also been demonstrated that Hēmolac acts as a prophylactic against the common catarrhal infections of the respiratory and alimentary tracts. The morbidity rates of the infants supplied with the extra iron in Hēmolac, was less than half that of the controls fed on diets without additional iron. It is significant that ultra-violet ray and vitamin therapy were without effect.

Clinical samples and literature will gladly be sent on request to any Medical Practitioner

BETTER MILK FOR BABIES

ORDINARY MILK

1/1,000 c.c. plated—over 200,000 bacteria per c.c.

LACTOGEN
Full strength mixture.

1/10 c.c. plated—less than 100 bacteria per c.c.

FACTS ABOUT LACTOGEN

Purity

Lactogen is under hygienic and scientific control from the time the raw milk is collected until the despatch of the finished product.

The fresh milk used for its preparation is obtained from selected farms, the herds receiving close supervision from the Company's farm inspectors.

A stringent examination is also carried out in the factory laboratory, and with these precautions a constant high degree of purity is maintained.

The modern manufacturing process is carried out under the most strictly hygienic conditions, and the bacterial count of Lactogen, as reconstituted, is less than 100 organisms per c.c.

Lactogen is prepared in England by Nestlé's—famous for more than fifty years for the purity of their milk products—from the pure, fresh milk of specially selected herds, grazing on picked English farms.

Lactogen is neither a new nor untried product. First introduced in Australia, it has for many years enjoyed a large sale in overseas countries.

FREE SAMPLES with detailed descriptive literature will be sent to any Member of the Medical Profession upon request.

ON
RECOGNITION AND TREATMENT OF BIRTH INJURIES IN THE NEWLY BORN*

BY

G. B. FLEMING, M.D., F.R.F.P.S.

PHYSICIAN, ROYAL HOSPITAL FOR SICK CHILDREN, GLASGOW

The infant in its passage through the genital canal probably experiences more severe trauma than at any future stage of its existence. Few adults could survive such an experience. It is small wonder, then, that some infants die forthwith from what is miscalled "asphyxia pallida," really from shock, and that others die in a few days as the result of birth trauma. The majority fortunately survive, but all are injured to a greater or less extent. From Cruickshank's[1] pathological work on neo-natal mortality, it appears that about 30 per cent. of all neonatal deaths are due to birth injury. The minor injuries are complacently dubbed physiological, though an adult with a caput succedaneum or cephalhaematoma would certainly not consider his condition physiological.

There is a remarkable contrast between the recuperative powers of infants from sepsis and from injury. To the former they show little, while to the latter they show wonderful powers of resistance. Injuries to the skin and subcutaneous tissue, in the absence of sepsis, usually heal without leaving either deformity or disability. Fractured bones nearly always unite with great rapidity and without deformity. Injuries to the viscera on the other hand are usually fatal, at least those that are recognized usually end in death, though there must be many minor injuries which pass unnoticed and leave no after-effects. Of all the birth injuries those to the nervous system are most likely to leave permanent disability, though here again a grossly paralysed limb may, within a few weeks, recover completely, and even intracranial haemorrhage may be absorbed without leaving any disability either mental or physical. Retinal haemorrhages always clear up within 10 days or a fortnight. Once the first critical days have passed, if infection be avoided, most infants make a rapid and complete recovery from the trauma of birth. Of the deaths from birth injury 68 per cent. occur in the first three days of life.[1] If the trauma is insufficient to kill rapidly the majority recover completely.

The present paper is based on the case records at the Royal Maternity Hospital, Glasgow, over a period of 3½ years. During that time all the infants who had received recognizable birth injuries were under my care. In this period approximately 8,000 infants were born alive, and from these I have records of 350 more or less severe birth injuries.

The birth injuries are best classified on an anatomical basis—injuries to the skin and subcutaneous tissues, to the muscles, to the bones, to the viscera, and to the nervous system.

INJURIES TO THE SKIN AND SUBCUTANEOUS TISSUE

Even in normal labour some injury to the skin and subcutaneous tissue always occurs. Many of the injuries are of minor importance and clear up so rapidly that in a few days no trace can be found. The caput succedaneum in vertex presentation may be said never to give rise to trouble. In face presentation, however, the oedema and swelling of the lips and buccal mucous membrane may interfere with sucking. In breech presentation the vulva or penis and scrotum may be severely bruised and oedematous; in these cases danger of sepsis is considerable, for it is almost impossible to protect the damaged tissues from contact with the excreta. Cellulitis arising from this cause is not uncommon.

Severe bruising of the scalp with forceps or from pressure on the promontory of the sacrum may lead to sloughing of the soft tissues. This most commonly occurs when there is an abrasion of the injured scalp which becomes infected. The sloughing may extend down to the skull and a considerable area of bone may be laid bare. The greatest care should be taken to protect these abrasions from infection. Misapplied forceps may cause very extensive damage. I have seen a case in which, besides numerous fractures of the skull, one of the ears was almost severed from the head.

The cephalhaematoma only rarely gives rise to trouble. It can be recognized by the limitation of the swelling to the margins of one of the flat bones of the skull. Its edges are usually firm and the condition must not be mistaken for a depressed fracture. Meningoceles which may simulate this condition alter in tension with changes in intracranial pressure and are situated over sutures. Only on very rare occasions does the cephalhaematoma become infected, and in the absence of infection it is always absorbed, leaving no trace.

The subcutaneous tissues are sometimes damaged by pressure and the condition of adipo-necrosis neonatorum produced.[2] These lesions consist in round or elongated indurated swellings immediately under the skin. They are usually of a dusky red colour and are not tender. The upper parts of the neck, the back, and the shoulders are the usual areas affected. They disappear in 5 or 6 weeks after birth.

Bednar's ulcer, though strictly speaking not a birth injury, occurs so soon after birth that it is worthy of mention. It is an ulcer of varying size on the palate or fauces and is caused by the misguided efforts of the attendant in attempting to clear mucus from the pharynx of the newborn infant. In itself the injury is of minor importance, but it provides a portal of entry to infection, and on this account all procedures which are likely to damage the very delicate mucous membrane of the infant's mouth or pharynx should be avoided. The ulcers usually heal rapidly without treatment.

INJURIES TO MUSCLES

The only injury to muscle which calls for special comment is injury to the sterno-mastoid muscle. Sometimes the coincident swelling of the skin and subcutaneous tissues of the neck may prevent recognition of the muscular lesion for 2 or 3 days. It is almost always situated in the lower half of the muscle and may reach the size of a pigeon's egg. There is considerable difference of opinion regarding the nature and cause of the swelling. Some consider it to be due to rupture of the muscle in cases of difficult labour, while others think it is caused by ischaemic contracture of the muscle resulting from prolonged venous stasis either during labour[3] or *in utero* before labour commences.[4] There does not seem to be any sound reason why simple rupture of the muscle should result in extensive fibrosis and wry-neck, and it seems probable that the cases which show this deformity are due to venous obstruction and ischaemic contracture.

FRACTURES

Fracture of the Skull.—The most common fracture as might be expected, is fracture of the skull. I have records of 16 cases, and it is probable that others occurred but were not detected owing to the displacement being of minor degree. Of these cases 14 were vertex presentations and 2 breech. There were five deaths. Three occurred

* Read in opening a discussion in the Section of Diseases of Children at the Annual Meeting of the British Medical Association, Eastbourne, 1931.

within two days of birth, and in each case there was very extensive damage to the meninges and laceration of the brain. One child died when 10 days old and one when 6 weeks old from gastro-enteritis. Only one infant required operation; he made a good recovery. The commonest bone to be fractured was the frontal—9 cases in this series. In one, the orbital plate of the frontal bone was fractured and there was great haemorrhage into the orbital cavity. Recovery, however, was complete. The parietal bone was damaged in 5 cases, and the temporal and occipital bones each in one case. The fracture usually occurs in cases of difficult labour and is commonly caused by one of the forceps blades, though in women with deformed pelves the sacral promontory may cause the damage.

Surgical intervention should as a rule be avoided. The infant's skull is so elastic that depressions in the skull are unlikely to cause symptoms from increased intracranial pressure. Symptoms may arise from damage to the underlying brain or from haemorrhage from a torn tentorium or falx, but surgical treatment cannot restore damaged brain substance, and the structures in the region of the brain stem are beyond its reach. Experimentally it has been shown that fracture and depressions produced by slow localized pressure do not cause damage to the brain or meninges.[5] For these reasons it is only in those cases where there are definite signs of active mischief at the site of the fracture that operative procedures should be undertaken.

Fractured Clavicle.—Fracture of the clavicle occurred in 8 cases in this series. It was right-sided in 3 cases, left-sided in 4, and in one case double. In one infant, a breech presentation, there was a right-sided Erb's paralysis and a fractured left clavicle. In 4 of the cases the presentation was breech and in 4 vertex. In all the cases in which the presentation was vertex the infants were very large and the labour difficult. Manipulative interference with the delivery of the shoulders is thought by Hukewytsch[6] to be a frequent cause of the fracture. There is seldom much displacement of the bone and on this account the condition is often overlooked, or owing to immobility of the arm it may be mistaken for Erb's paralysis. An early sign is swelling of the soft tissue over the affected clavicle,[6] and the callus, which forms in a few days, makes the diagnosis plain. As the newborn infant habitually lies on his back elaborate methods of fixation are not necessary. A pad may be strapped between the shoulder blades in order to throw the shoulders back, and the arm of the affected side may be fixed to the trunk. The fracture almost always unites without leaving any deformity. This is said to be due to the fact that in early infancy the thorax grows so quickly that overlapping is naturally counteracted.[7]

Fracture of the Humerus occurred in 8 cases, 5 of which were left-sided and 2 right-sided; in one, both bones were fractured. In 7 cases the presentation was by the breech and in one by the vertex (occipito-posterior). The fracture usually occurs in the upper third of the bone and is probably always due to manipulative interference. The immobility of the arm, the swelling and the crepitus, which can usually be elicited, make the diagnosis clear. In newborn infants it is extremely difficult to fix a limb to an ordinary splint; the converse, to fix a splint to a limb, is possible, but useless. Probably the best and simplest method of splinting the humerus is to wrap a thin layer of gamgee round the arm and then encircle the limb from the shoulder to the elbow in a fairly firmly applied band of adhesive plaster. The arm may then be fixed to the side with the elbow bent at a right angle. In some cases the same type of splint as that used for Erb's paralysis is useful. By this means the arm is fixed in a position of abduction and external rotation with the forearm flexed at a right angle. The results are almost always excellent. In one of my cases, however, there was damage to the musculo-spiral nerve with drop-wrist. This disappeared in two months.

Fracture of the Femur occurred three times, twice in breech presentation and once in a case delivered by Caesarean section. In the latter the fracture almost certainly occurred when the infant was being extracted from the uterus. The diagnosis is usually easy, but in one of the cases, in which the fracture was in the lower third of the bone, there was great swelling of the leg as well as the thigh, and the fracture was thought to be in the tibia. This was disproved by *x*-ray. The best method of fixing the bone is by vertical extension with the thigh at a right angle. A light bar of wood across the top rail of the cot provides a satisfactory fixture from which to suspend the limbs. This position is not uncomfortable and it has the great advantage of enabling the buttocks to be cleansed without disturbing the affected limb. In all the cases union was sufficiently firm in three weeks to permit us to dispense with the extension apparatus. The results in all cases were satisfactory. In fixing the limbs of newborn infants the greatest care must be taken not to cause damage to the skin from pressure. For this reason wooden or metal splints are not to be recommended. Even a sharp edge of adhesive plaster pressing on one of the folds of the axilla may produce a dangerous abrasion. It is therefore of great importance to inspect the fixation apparatus frequently and to reapply it if there is any suspicion of underlying damage.

INJURIES TO THE VISCERA

Injuries to the organs in the thorax or abdomen are not as a rule recognized during life. It is common in cases of asphyxia to find at necropsy pleural or pericardial haemorrhages. Cruickshank[1] found visceral haemorrhage 81 times in 800 neo-natal deaths (lung 28 cases, liver 18 cases, suprarenal 23 cases, kidney 20 cases and retroperitoneal tissue 1 case). In one case that came under my notice there was a large swelling in the region of the left kidney; the urine was normal. In 9 weeks the swelling had become much less but could still be detected; at the age of 5½ months no trace of the swelling could be found. I think this was a case of perirenal haemorrhage. The testicles may receive injury in breech presentation. I have seen several cases in which there was great swelling of one or both testicles probably due to haemorrhage into the tunica vaginalis. These swellings usually subside rapidly and leave no trace.

INJURIES TO THE NERVOUS SYSTEM

Of all birth injuries those to the nervous system are most likely to leave serious and lasting disability. Injury to peripheral nerves may result in permanent paralysis, while intracranial or spinal trauma is not only an important cause of neo-natal death, but may, in the infants that survive, give rise to most serious sequelae. In these injuries the remarkable recuperative power of the infant shows itself in the same way as is seen in injury to other tissues, but, none the less, damage to the nervous system gives rise to serious sequelae more commonly than any other birth injury.

Injury to the Peripheral Nerves

The two common lesions are injury to the facial nerve and to part or all of the brachial plexus. It is extremely rare to meet with damage to other nerves though paralysis from injury to the sciatic and peroneal nerves has been recorded.[8] I have records of two cases of paralysis of the

anterior tibial muscles. One was a case of breech presentation; the presentation of the other is unknown as the child was born before admission to hospital. Both infants made good recoveries. In these cases it is extremely difficult to differentiate between paralysis from injury to peripheral nerves and paralysis from damage to the spinal cord. Retention of urine and loss of the anal sphincter reflex point to cord injury.

Facial Paralysis

This is usually caused by pressure on the 7th nerve in its course outside the skull, though the nucleus or the nerve trunk in its intracranial course may be damaged by fracture or haemorrhage. In the great majority of cases the paralysis is caused by pressure of a forceps blade on the nerve after it leaves the sterno-mastoid foramen. The paralysis may be complete or partial, the extent depending on whether the main trunk of the nerve or only some of its branches have been damaged. The condition is easily recognized; when the child cries the mouth is drawn to the sound side, the eye on the affected side does not shut and the face on that side remains impassive. There is usually some swelling and bruising in the region of the mastoid. Sucking is not interfered with. Treatment is unnecessary though the local bruising and excoriation may require attention. I have records of 66 cases. The presentations were as follows: 62 vertex (of which 6 were occipito-posterior); 2 face; 1 infant delivered by Caesarean section after labour had been in progress for two hours; the presentation was not recorded in one case. Sixty-three of the infants were delivered by forceps. The paralysis almost always passes off in 1 to 2 weeks. In one of my cases there was still slight paralysis after 8 weeks, but it is possible that in this infant the lesion was of central origin as there was a shallow depression in the fronto-temporal region on the contralateral side though there was no other paralysis suggesting an intracranial lesion.

Brachial Paralysis

Paralysis of the arm from injury to the brachial plexus is the most important peripheral nerve lesion as it is extremely common, though less frequent than facial paralysis, and produces grave crippling if recovery is incomplete. Two principal forms are recognized. In one (the Erb-Duchenne type) the paralysis is due to damage to the 5th and 6th cervical roots or the trunk formed by their union. In the other (Klumpke's type) the injury involves the 7th and 8th cervical and first dorsal roots. Atypical forms are also met with; the whole limb may be affected or single muscles such as the deltoid or supinator longus alone may be paralysed. There is considerable difference of opinion as to how the injury is produced. Some hold that it is caused by pressure on the brachial plexus from the forceps, the hand of the obstetrician, or the clavicle in cases where there is difficulty with the delivery of the shoulders; others think that stretching or even laceration of the nerve trunks or spinal roots is responsible. Probably over-stretching of the nerve trunks is the most common cause.[9] In the Erb-Duchenne type the muscles most commonly affected are the deltoid, the supra and infra spinati, the teres minor, the biceps, the brachialis anticus and the supinator longus. There is probably little or no sensory loss. The signs are characteristic. The arm is internally rotated and held close to the side, the forearm is extended and pronated. Supination and flexion of the forearm is impossible and the arm cannot be abducted or rotated outwards. Klumpke's paralysis is much less common than the Erb-Duchenne type. In this condition the triceps and practically all the muscles of the forearm and the hand, except the supinator longus, are paralysed. The forearm is flexed at the elbow and supinated. The hand is flaccid. In this form of paralysis there may be narrowing of the palpebral fissure and myosis on the affected side from damage to sympathetic fibres. In rare cases there is paralysis of the whole arm. In these the whole plexus has been injured. The recognition of the condition is as a rule easy, though fracture of the clavicle or humerus may at first be mistaken for true paralysis on account of the immobility of the arm. The pseudo-paralysis of osteochondritis is practically never present at birth; pseudo-paralysis from scurvy never occurs till about the age of 6 months; paralysis from poliomyelitis is never present at birth. Paralysis from cerebral lesions is of the upper neurone type. It is, however, not always easy to distinguish between upper and lower motor neurone paralysis in the newborn. I have found the embrace reflex[10] of some assistance in this respect. If the infant is laid on his back on a table and this is suddenly struck with the hands on each side of the infant a normal child or one with an upper motor lesion will abduct its arms and then, with the forearms flexed, bring the limbs towards the middle line, going through the motion of an embrace. In lower motor neurone lesions the affected arm will remain immobile.

It is most important to recognize brachial paralysis early, for the earlier treatment is commenced the better the result. The guiding principle, as in the treatment of all lower motor neurone lesions, is to place the affected muscles in a position of relaxation and to maintain them thus for a prolonged period of time. For the first few days after birth, or at any rate till a satisfactory splint can be made, the affected arm should be fixed in an abducted and externally rotated position with the forearm flexed to a right angle and supinated. This can be done by fixing a band of adhesive plaster round the child's wrist and pinning this to the pillow with the arm suitably abducted and the forearm flexed and supinated. In the less severe cases recovery begins to show itself in a few days. Frequently, however, it is necessary to fix the arm in a splint. Plaster of Paris may be used, but this is heavy and liable to harbour dirt. Light pexaloid or vulcanized fibre splints are the most useful. The splint consists of a wide body-piece moulded to and partially encircling the thorax; from this the arm-piece springs at a right angle and from this the forearm and hand portion of the splint is set at a right angle; this section of the splint is set in a position to hold the forearm in full supination. By this means the arm can be fixed in an abducted and externally rotated position with the forearm flexed at a right angle and supinated. The arm should be kept fixed in the splint night and day for at least six months unless recovery takes place before then. Subsequently operative procedures may be resorted to. Good results have been claimed from nerve suture,[11] but I think the present opinion of most surgeons is that there are few cases in which this operation is advisable. Operation on the muscles of the shoulder joint to permit of external rotation of the arm are, however, of considerable value.

I have records of 28 cases of brachial paralysis. Twenty-seven were of the Erb-Duchenne type and showed considerable variation in the extent of the paralysis. In one other there was complete paralysis of all muscles of the right upper limb. Twenty-one of the cases recovered completely within 3 months of birth, 5 are still under treatment, and though 4 have made some recovery they still show more or less severe disability. In all of them fair abduction of the arm can be obtained, but this is chiefly achieved by scapular movement. The supinators are still paralysed and owing to unopposed action of the teres major muscle there is internal rotation of the arm. The case with complete paralysis of all arm muscles shows no improvement after 10 months. Two cases have been lost sight of.

Injury to the Spinal Cord

This is commonly produced during breech extraction. Probably many of the fatal cases pass unrecognized. Damage to the upper cervical region is necessarily fatal. Crothers and Putman[12] have reported 28 cases in which the child survived injury to the lower cervical, dorsal or lumbar regions. The symptoms are those of transverse myelitis, and depend on the site of the lesion in the cord. The diagnosis is often difficult, especially as sensory disturbances in young infants can only be determined in a very rough-and-ready way. Cerebral lesions and injuries to the brachial or lumbar plexus or their spinal roots are sometimes difficult to distinguish from injuries to the cord itself. The treatment consists in education of muscles and sphincters and orthopaedic measures to correct deformities and contractures.

Intracranial Haemorrhage

Haemorrhage within the cranium of the newborn is extremely common. Eardley Holland and Lane-Claypon[13] found it present post mortem in 25 per cent. of still-births and neo-natal deaths, while Cruickshank[1] in a series of 800 neo-natal necropsies found gross haemorrhage in 20 per cent. Capon[14] has emphasized the frequency with which it occurs in premature infants. The most common lesion is tear of the tentorium, though damage to the falx cerebri or to the tributary veins of the longitudinal sinus or to the veins of Galen may also give rise to bleeding, while haemorrhage from the choroid plexus may fill the ventricles with blood. Haemorrhage of any extent into the brain substance is probably not very common, though Schwartz[15] holds that petechial haemorrhages into the brain substance are of frequent occurrence. Reuss[16] does not consider these petechiae to be of pathological importance.

Unfortunately it is extremely difficult to diagnose intracranial haemorrhage with certainty during life, and for this reason it is impossible to estimate the proportion of infants who survive. The diagnosis even post mortem is not always easy. If the head is opened by the method of Beneke,[17] and the dural septa thereby preserved, the brain must be removed piecemeal and only gross lesions in its substance can be detected, while if the brain is removed intact the membranes are damaged to such an extent that rents and subdural haemorrhages caused during birth cannot be recognized. By injecting the arteries of the brain and meninges through the carotid artery with opaque fluid and taking *x*-ray photographs (preferably stereoscopic) before the head is opened, haemorrhages can frequently be displayed and located. This method has been successfully used by Campbell[18], Roberts,[19] and Allen and McClure.[20] It seems to me that the difference of opinion among pathologists regarding the frequency of cerebral and meningeal haemorrhage is to some extent due to differences in method of examination.

The diagnosis during life is usually even more difficult. Some cases can be recognized without doubt, but I must confess that on numerous occasions I have been astonished to find at post-mortem examination a quite unsuspected intracranial lesion. I imagine others have had the same experience.

The signs pointing to intracranial haemorrhage are drowsiness, feeble cry, inability to suck, muscular rigidity, even at times simulating tetanus,[21] convulsions, bulging fontanelle, intermittent attacks of cyanosis. Any or several of these signs may be present without intracranial haemorrhage, though Clein[22] holds that intermittent attacks of cyanosis are diagnostic. Bulging fontanelle is not very common, and the other signs mentioned may arise from various causes. A definitely pigmented or uniformly blood-stained cerebro-spinal fluid with crenated red cells is probably the most important manifestation available. Even this sign does not afford absolute proof. It is held by some that the cerebro-spinal fluid of all premature infants is tinged with yellow.[23] Possibly haemorrhage or capillary oozing occurs in a large proportion of newborn infants, especially in premature babies. Judging by the frequency with which haemorrhage into the retina (the only part of the central nervous system that we can see) occurs, it seems possible that capillary haemorrhage from the meninges may occur with equal or even greater frequency. In 349 infants without any other birth injury Dr. Morton and I[24] found retinal haemorrhage in 88 (25 per cent.). Other observers[25] have recorded an incidence of 23 per cent. *In 81 cases with intracranial haemorrhage we found it in* 38 (47 per cent.), while 23 patients of our series died before examination could be carried out; probably an even larger proportion of these would have shown retinal haemorrhage.

Certain fallacies must be guarded against in examining the spinal fluid. The spinal theca of the newborn infant is of such small calibre that veins in the spinal canal are very easily injured during the puncture, and blood may thus be introduced into the specimen. The fluid should always be centrifugalized as soon after withdrawal as possible; a definitely yellow supernatant fluid is strong evidence of haemorrhage. The presence of crenated red cells is also of significance, but here again a fallacy lurks. If the cells are exposed to any haemolytic agent, water, alcohol, etc., they become crenated. It will be seen, therefore, that there are many pitfalls, and even after exercising the utmost care it is impossible in some cases to be certain of the diagnosis.

Treatment must to a great extent be symptomatic. Careful and skilled nursing is essential. If the child is unable to suck, food should be given by the stomach tube; this is a much more satisfactory method than giving it by the spoon or pipette. Some think[26] that the condition is commonly associated with haemorrhagic disease of the newborn, and, if there is any suspicion of this, whole blood should be injected subcutaneously. I do not think, however, that this is a common cause. I have never seen symptoms of intracranial haemorrhage in a frank case of haemorrhagic disease. If there are signs of increased intracranial pressure lumbar puncture is of use, while, if the great fontanelle is tense and bulging and is not relieved by lumbar puncture, fluid should be withdrawn from the cerebral ventricles. Convulsions should be prevented as far as possible by giving chloral; 1-grain doses at two-hourly intervals will usually suffice. Good nursing is of more importance than any active therapeutic measures; it requires the greatest skill and experience, and unfortunately few nurses have the opportunity of acquiring a knowledge of this most important branch of their subject.

The sequelae of intracranial injury are of importance. The most common are mental deficiency, asymmetrical spastic paralyses and hydrocephalus; probably true spastic diplegia owns a different cause.[27 & 28] In 33 cases which Morton and I[24] followed up for a year or more 5 were found to be mentally deficient, and in 4 of these there was spasticity of one or more limbs. One infant was hydrocephalic, and one of them presented the picture of true spastic diplegia. Munro[29] followed up 48 infants with intracranial birth injuries and found cerebral defects in 7 cases. Orthopaedic measures may do much for the paralyses, and removal of the appropriate sympathetic ganglia is yielding hopeful results.[27] Obstructive hydrocephalus has been successfully treated by operation,[30] but the risks are great.

CONCLUSION

The prevention of birth injuries lies with the obstetrician, the treatment with the paediatrician. Obstetric manœuvres employed on behalf of the mother are frequently the cause

of injury to the child The induction of premature labour may be essential for the wellbeing of the mother, while for the infant a Caesarean section at term would be a safer procedure The use of anaesthetics and opiates may be necessary for the mother, but it cannot be advantageous for the infant to arrive in its new surroundings in a drugged state Ante natal treatment must prove of advantage to both mother and child Treatment can sometimes be instituted so that pregnancy may be allowed to go to term and malpresentation can be rectified before labour commences By ante natal care there should be reduction in both the maternal and neo natal death rates

SUMMARY

The points in the recognition and treatment of birth injuries that I would emphasize are

1 The prevention of sepsis in even the smallest superficial abrasion

2 The recognition and treatment of fractures

3 The recognition and early treatment of injuries to nerves

4 The careful nursing of the infant with intracranial damage

SORE THROATS OF OTHER THAN TONSILLAR ORIGIN*

BY

BEDFORD RUSSELL, F R C S

SURGEON IN CHARGE, THROAT DEPARTMENT, ST BARTHOLOMEW'S HOSPITAL

The aim of this paper is to emphasize the importance of the nose in the production of faucial and pharyngeal complaints The way in which tonsils affect the nose is well recognized, but the converse is also true There is nothing new in the idea—I find the connexion mentioned in the textbooks, but I think that this connexion is often missed to the detriment of the patient I am assuming that dental sepsis has been eliminated in all the cases under discussion, and that the alimentary canal is healthy

Now it is unfortunately impossible for a laryngologist to follow up all his cases of tonsillectomy and see if the operation has always succeeded in stopping sore throats, but general practitioners have sometimes the thankless task of so doing, and I suggest that they have sometimes been disappointed in the results of tonsillectomy done for this purpose One reason why this aspect of sore throats has to be examined afresh is a change that has arisen with regard to the skill displayed in tonsillectomy Before the war, the explanation of the failure to cure symptoms was often that portions of the tonsils were still present after operation, especially during the period of enthusiasm that followed the demonstration by Sluder and by Willis about 1910 that one could completely enucleate tonsils with the guillotine, and for ten or fifteen years the prevalence of tonsillar remnants and of scarred up palates sufficiently explained the many failures to cure throats by tonsil operations But although skill acquired by practice has led to a noticeable decrease in the number of incomplete operations, yet we not infrequently see cases, both in children and adults, of sore throats persisting in spite of careful removal of tonsils and adenoids especially in certain years This was the case in 1919 and 1929 and also this year—a point to which I will return later

PHYSIOLOGY OF NOSE AND THROAT

It would be well here to consider for a moment some of the physiology of the nose and throat Too little work has been done in this direction, and so difficult are the problems that there is not even yet a well defined and generally held belief in the function of the tonsil and the rest of the lymphatic tissue in the nasopharynx One has one's choice of beliefs, therefore, and I would range myself on the side of those who regard the tonsil as a sort of immunity factory Long after any nasopharyngeal infection, and often during epidemics in which the individual has escaped infection, one can find in the tonsillar crypts the epidemic organisms in the act of being ingested by white corpuscles And having regard to the lack of epithelium at the bottom of the crypts and to their close relationship with the deep cervical lymphatics it is reasonable to suppose that the endotoxins thus liberated are passed via the tonsillar lymphatic channels and the thoracic duct into the blood stream, with a view to the production of antibodies against the organisms in question Be the interpretation what it may, however, it does seem that it is the proper function of the fauces to inflame at the intrusion of micro organisms An illustration of this, more familiar to laryngologists than to practitioners, is the rare case in which the patient complains of sudden sore throat on one side, associated with the occurrence of secretion in the throat for which there appears to be no origin I saw such a case in which the nose was demonstrably guiltless, and yet there was the pus whenever the throat was inflamed One day a large discharge of pus was seen issuing from the mouth of the Eustachian tube, due to an overlooked otitis media in which presumably an infection had persisted long after the pharyngeal part of it had cleared up, and the cause of the sore throat was clear While on the subject of what may be termed this "watch-dog" function of the fauces, it is illuminating to remark upon the absence of this property in the buccal mucous membrane This mucosa takes little or no notice of dental sepsis at a time when the fauces may be responding most actively to this very same insult Some change then, takes place in the function of the mucous membrane at the anterior pillars of the fauces, the faucial mucosa and the buccal mucosa are very different organs I contend that one of the duties of the faucial mucosa is to register indignation at the arrival of strangers at the gates, in which case a sore throat may sometimes have to be regarded as a remedial effort—in

* Read in opening a discussion in the Section of Oto-Rhino-Laryngology at the Annual Meeting of the British Medical Association, Eastbourne, 1931

attempt to draw attention to infection from elsewhere. And rather than try to stop the dog's bark, we should try to find out what he is barking at!

These suggestions are not scientific, I am afraid; but I find no need to apologize for this. It is not given to all of us to have the time or the special ability to make the long series of controlled observations necessary for definite statements; but I submit that there is value in clinical impressions remaining after numerous observations, even if uncontrolled. Luckily there are some among us who, though in active practice, have the divine spark of curiosity coupled with the necessary mental outfit; and our specialty occasionally gets the benefit of the light thrown by methodical examination upon clinical material.

The cilia were rediscovered by StClair Thomson in 1895. And again Mr. Yates in his *Modern Treatment of Catarrh* has shown us how to appreciate just what a prominent part these much neglected little organs play in the hourly war which the nasopharynx is waging against inspired organisms. For the benefit of those who may have had time to keep up with recent work, we will touch briefly upon some of his researches. If Indian ink is introduced into a sinus, it presently appears at the mouth thereof, and thence proceeds as a thin black line by quite a definite path, to a position in the nasopharynx above the Eustachian orifice. The ink then descends behind the Eustachian cushion, and finally reaches the opening of the oesophagus, where it is duly swallowed. The black line can occasionally be seen to send an outlier which passes over the posterior pillar of the fauces—runs over the tonsil, and then rejoins the parent stream. When one knows the classical pathway, it is most intriguing to watch mucopus following the path (which it can be seen to do during a sinusitis, before definition becomes swamped by a large amount of discharge). And when one has become familiar with the route, one can, from the position of the redness in the pharynx, get a fairly good idea whether a sore throat is nasal in origin or not. Yates did another important piece of work of clinical value by showing that if indigocarmine be introduced into a nose in which the ciliary activity is normal, it is swept down via the usual pathway in blue lines, which can be wiped off; whereas from a nose in which ciliary activity is depressed or absent the dye appears in blue lines *behind* the pharyngeal mucosa—lines which cannot be wiped off and which are sub-mucosal lymphatics. This is a most convincing test, which anyone can carry out without special technique, and is easily demonstrable in the type of case I wish to discuss, that of faucial inflammation caused by sinusitis. A little more of physiology before we consider the clinical aspect. Is it ever recognized what a huge area of mucus-producing membrane there is in the nose and accessory sinuses? I have not been able to think out how to measure it accurately, but if one calls the septal area four inches by two, it is evident that the total area is 30 square inches or more; this explains in some measure where all the phlegm comes from. Further, the nasal mucosa should, in health, be of a nice pink colour, and should be moistened with clear transparent mucin; these conditions should normally be present upon both sides of the nose. Finally by transillumination, light should glow evenly and clearly through symmetrical crescent-shaped areas in the infra-orbital region, and all sinuses should be translucent to *x* rays.

CLINICAL FEATURES

What, then, are the symptoms and signs in a case of sore throat which should lead us to the idea that the inflammation may not be primary in the throat but that it is a mere result of infection higher up—in fact, what one might term a "nasal" sore throat? I think that perhaps the most characteristic thing about a nasal sore throat is its onset. When interrogating a patient, we are always taught to ask, "How long?" It has now become one's practice never to omit two other questions—"What began it?" and, "Is this the first time?" The patient may have no idea as to the origin of his trouble. But surprisingly often he may answer that it began after a pyrexial attack which occurred in February 1929, or even during influenza just after the war. To the second question he may answer that, having begun one winter, it now comes regularly whenever he gets a cold. Now if these answers were only to be obtained from patients with tonsils, we would be no wiser with regard to diagnosis. But the whole point of this paper is that these answers are characteristically obtained from patients in whom the tonsils have been correctly removed. Indeed, patients occasionally say that their habit of sore throats dates from tonsillectomy. (So much so as to give rise to a fleeting pang of doubt as to whether nasal sore throats, or in other words sinusitis, were not actually to be caused by the removal of some necessary function of health vested in the tonsil.)

Another thing which may point to a nasal origin for a sore throat is its frequent asymmetry. Indeed, I would say that one should always suspect a nasal origin when one side of the throat is noticeably worse than the other, even in children. I will quote from a letter of an observant doctor:—

"Feb. 12th, temp. 102° F., cold and cough. Feb. 15th, temp. 100° F., rt. ear drum red. Large gland rt. mandibular angle. Rt. tonsil enlarged with white patch."

Transillumination showed that the right antrum was opaque and the left translucent. This is confirmed in the radiograms shown. The age of that patient was, and still is, just over three years. Before the war the existence of sinusitis in children was not widely recognized, and we owe a great debt to Cleminson in this country and Dean in America for demonstrating not only that it could occur, but that it occurs very commonly, if only transiently.

So far, then, we have the onset and the asymmetry to guide us. The nature of the soreness, best recognized in the tonsil-free patient, may help in diagnosis. It is usually worse in the morning, and persists until the patient has brought up some phlegm from the back of the nose or the throat. Other indications of nasal origin are rashes upon the skin of the nose and lips, redness of one eye, pain or inflammation in one ear, and an excess of secretion sticking upon the hairs of one nostril. In the throat itself, one can get more direct evidence by examining the posterior pharyngeal wall, upon which there is often a very obvious coating of yellowish discharge. If one is obsessed with the tradition that tonsils are the sole cause of sore throats, one can disregard this film as completely as one can disregard the messages from the unemployed eye when using a microscope. The attitude which is content to assume that this evidence of nasal inflammation is merely an example of nasopharyngitis produced by inflammation in the tonsils is falsified when one realizes that the same appearances are found in the tonsil-free patient. If the film is transparent and difficult to see, it can be made obvious in a tolerant patient by lightly sweeping a blunt probe across the posterior pharyngeal wall. Whatever the condition of the tonsils, the presence of a large sheet of post-nasal mucus must cause one to suspect the nose; the mucus glands in the post-nasal space are not enough to produce a large and constantly moving sheet of discharge. As a practical point, great relief may be afforded by removal of sticky secretion that has defied the patient's own efforts. Another very important piece of evidence is to hand if there are laryngeal symptoms, or a cough, accompanying the sore throat. Personally, I have begun to doubt whether

laryngeal symptoms ever occur with what I call a "primary" tonsillitis; the nose and larynx work together in these affairs, and if tonsillitis be present as well, it is often to be regarded as a mere *result* of the nasal disturbance. Tonsillectomy in such cases is worse than useless. One may instance the parallel of the erstwhile fashionable operation of cutting off a piece of a lengthened uvula, with a view to curing a cough. Although it was utterly unsuccessful in achieving its purpose, although laryngologists no longer advise it, and although, from the position of the uvula and its relationship to other parts, the operation could never have been reasonably expected to cure a tickling cough, yet it was earnestly carried out all over the world during a period of, say, twenty years. One still gets patients sent up for it to be done. Similarly, the removal of tonsils is earnestly carried out with a view to curing what is obviously a nasopharyngitis, although the trouble can be seen to go on occurring just the same in spite of the operation.

To return to our review of the circumstantial evidence which should make us suspect a nasal origin for a given sore throat. I have confined myself so far to signs evident without special instruments or special training. In the nose the most obvious thing is the colour of the mucosa; any departure from the normal, especially if on one side, increases our suspicions, and any departure from normality in the amount and nature of the discharge takes us a step further. The most difficult cases, and this year a type very commonly met with, are those in which the appearance of the front of the nose is above suspicion, and transillumination normal. In these one should examine the post-nasal space shortly after a shrinkage of the nasal mucosa followed by a gentle wash-through of the nasal passages with a 2 per cent. solution of sodium bicarbonate. If one is persistent, and lucky in choosing the moment, one will discern an exiguous trickle of muco-pus appearing over the top of the posterior end of the middle turbinate, and will be able to make a presumptive diagnosis of posterior ethmoiditis or sphenoiditis. Whereas also the faucial symptoms are singularly unrelieved by the usual paints and gargles, immediate improvement follows the removal of the load of phlegm with which the cilia have been unable to cope because of its viscosity. Most people over the age of five can be taught to wash the nose out with a couple of drachms of a warm 2 per cent. solution of sodium bicarbonate from a coarse spray, repeated in about ten minutes. The first application softens the phlegm, and the second initiates a process of removal which can thenceforward be carried on by the cilia. The relief thus obtained lasts for about an hour—that is to say, until the next lot of phlegm has taken the place of that removed.

TREATMENT

Granted, then, that we have a case of sore throat presenting all the above-mentioned stigmata of a nasal origin, what line of treatment should we follow? In a case of an antrum which is dark to transillumination, and obviously overflowing into the middle meatus of the nose, the indications are easy—we must wash out the antrum. Such a procedure should precede or replace any question of tonsillectomy. For one thing, tonsillectomy is not of much avail when the cause of the trouble is still maintaining its bombardment of the virtuously indignant pharynx; and for another we cannot hope for an easy passage as regards operative, reactionary and secondary haemorrhage where there is still in the nasopharynx a cause of reflex vasodilation. I am beginning to think that bleeding with tonsillectomy is now a thing to be surprised at, and that it seldom occurs except in cases where we have overlooked some unresolved inflammatory process. Persistent pain, too, is rare after tonsillectomy, and its occurrence should make one suspect something outside the tonsils. I recall a case in which I had been satisfied with the appearance of the teeth and had found the antra translucent. Tonsillectomy led to pain on one side, with pyrexia persisting till the sixth day; transillumination then showed that one antrum had become opaque, the trouble having arisen from a "flare-up" in connexion with an overlooked dead tooth in the floor of the antrum. This is a digression: we were discussing the treatment of nasal sore throat, and agreed to wash out the antrum if obviously full up. There are numerous cases of latent sinusitis, however, in which diagnosis is not so simple. How shall we decide when we are dealing with one of these more recondite cases of sinusitis—an antral infection, say, which needs treatment? A perusal of most of the available textbooks will leave the student with the (perfectly safe) belief that if proof-puncture produces pus, then there is pus in the antrum! And this, furthermore, seems to be the only permissible indication for drainage.

Laryngology is not a very old subject; and before the war the number of observers who had the opportunity of becoming familiar with the vagaries of antral infections was limited; so that it was at that time desirable that indications for treatment should be outstandingly definite and incontrovertible. I submit that, in view of the increased number of trained workers, and of the long period during which the subject has now been studied, it is permissible and desirable to widen the indications for operative treatment of antral infections. If operative treatment of an infected antrum is withheld until one can definitely say there is an empyema, a very large number of people will continue to suffer from curable disease, not only from the sore throats we are here to discuss, but from catarrh, deafness, headaches, gastro-intestinal troubles, rheumatism and the like.

Now if the only antral operation is to be the Caldwell-Luc operation, carried out through the mouth as well as the nose, then perhaps it is best to defer operation unless there is an empyema, diagnosed with all the solemn and redundant ritual of proof-puncture; for if we are to await the ciliary breakdown which obtains in this degree of sinusitis it is probable that anything less than a Caldwell-Luc operation will be inadequate. But I, personally, have only performed this radical operation twice since the war, and as I find that a great many surgeons seldom perform it, I feel that there is a legitimate case for adopting another attitude about antral operation. I hold that we should operate earlier upon infected antra, and that the operation should consist merely of the provision of an intra-nasal opening, perhaps not more than half an inch in diameter, through which the patient can perform the regular lavage; and if the configuration of the nasal passage permits us to make this opening without touching the inferior turbinate, so much the better. We should rely more upon after-treatment; and the operation should not be regarded so much an attempt to wipe out the disease at one fell swoop, as the provision of an aperture to permit ventilation and to prevent the accumulation of discharge. The first aim of a sinus operation should be by ventilation and drainage, to encourage the restoration of ciliary activity, and the more we limit the severity of the operation, the less do we inhibit the return to normal. Our chances of being able completely to cure a sinusitis by a small operation diminish *pari passu* with the time we allow it to persist. There is this traditional belief that operation upon an antrum should [illegible] till pus can be washed out of it, and radicalists even go to the length of devising ingenious methods for showing a fluid level in an antrum. A high fluid level certainly indicates a breakdown in ciliary activity; but there are many gradations between normal activity and complete

breakdown, and if we wait for complete ciliary palsy it is a difficult business getting the cilia to function again.

We have in the history of appendicectomy what may prove to be in some measure a parallel to the treatment of antral infections. One of the chief indications for appendicectomy used to be a bulging of the abdominal wall by the abscess; and those who first advocated removing the appendix early enough to prevent such a state of affairs were regarded as enterprising, to use the least radical term. But the profession now prides itself upon early diagnosis, and upon removal of the appendix before it has made the patient really ill! Similarly we now do tracheotomy in time to prevent the very things which used to be given as the indications for tracheotomy. Surely the time has come to adopt a similar attitude with regard to antral infections, and to operate in time to prevent the occurrence of empyema.

LATENT SINUSITIS

There are some antral infections which begin suddenly, with obvious suppuration—inflammations which may yield permanently to one or two lavages. But the commonest antral infection is an insidious affair, the origin of which seems very often to be traceable to one of the big influenza epidemics, as mentioned earlier. It may occur in noses apparently quite normal in structure, but it is usually found in cases where the nose offers some pronounced mechanical predisposition. (In this connexion, perhaps someone at this meeting will be able to give us some fresh ideas as to why, in a nose with marked disparity between the two sides, the antrum on the roomier side is so often the one to show signs of infection first.) But even in the absence of mechanical troubles there are definite signs. The first thing to notice is the general appearance of the nasal mucosa. Is it moist, and pink as a kitten's tongue? No. On one or both sides the mucosa has the appearance of raw steak that has been allowed to dry, and in place of the colourless mucin which should moisten its surface there is a dryish, scanty film of muco-pus which over the middle turbinate is usually aggregated into small flakes. This appearance of the middle turbinate as a sign of recondite sinusitis is of the greatest value; but it is difficult to be sure of any diagnostic difference between its appearance in frontal, ethmoidal or antral infection. On palpation it is found that the mucosa over the middle concha, which should fit the bone like a glove, may be several millimetres thick, and may in ethmoiditis be actually oedematous.

Now for transillumination. There are laryngologists who soar above the evidence obtainable by this test. The meaning of a relative opacity may not be obvious, but it is not to be regarded as a criterion of normality. Transillumination cannot be dismissed with a wave of the hand; and it is surely our function to supply guidance as to the possible significance thereof. It is of particular importance in cases in which a previous transillumination has shown a symmetrical translucency. During the early stages of a nasal infection one usually finds that in place of a pair of clearly defined infra-orbital crescents, there are two equally vague and undefined sub-luminous areas—not black, but lacking their former clear-cut translucency. After a week or so, one infra-orbital crescent may clear up, while the other remains vague. Now what is the significance of this diminution of the normal light? Antral lavage at this stage may produce nothing, or at most a small "blob" of muco-pus—much too small to prevent the transmission of light. The dimness is due to hyperaemia or to oedema of the lining, and its existence is duly noted, chiefly for future reference, for hyperaemia on one occasion is no indication for operation. The importance of the discovery is that it is a contraindication to light-hearted tonsillectomy later on.

Let us suppose that we have a sore throat which presents all the stigmata of a nasal origin, and suppose the symptoms duly subside. We are in a stronger position when it recurs (for recur it will, if the antral lining is deeply infected) because we can note the reconstitution of our chain of circumstantial evidence as the separate items arise again. The first thing complained of is probably the sore throat; but I would here remark that there are probably always premonitory signs before the sore throat if one is lucky enough to see the patient at the right time. How often is a house-surgeon frightened by a rise of temperature after some clean operation, only to find 48 hours later that the patient complains of a sore throat. The temperature is not the only sign that precedes the sore throat. If in a suspected case you make a practice of transillumining the antra, you will suddenly one day find a dimness where there was usually translucency; whereupon you can safely tell the patient he will have a sore throat or a cold in a day or so. Sooner or later there will be a glazed look upon the middle turbinate, and a pharyngeal film, with tenderness of the glands. The presence or absence of the tonsils naturally leads to some alteration of the picture, but the knowledge gleaned during the previous attack will permit one to see the tonsillar involvement in its right perspective—namely, as a result rather than a cause.

CONCLUSIONS

It will be seen that this paper, ostensibly upon throats, is really a covert attack upon the antrum. I freely admit this, except that I would include hidden ethmoidal infection as being at least as frequent.

I urge no operation upon the ethmoids in this connexion, but I submit that there is a case for an early and not extensive operation upon the antrum; and believing as I do that it is doubtful whether the mucosa can ever return really to normal when once it has got to the stage of chronic empyema, I ask for the pontifical blessing of the Section upon indications for drainage based on the repetition of a convincing chain of circumstantial evidence rather than a belated positive result to a proof-puncture.

SUB-ARACHNOID BLOCK

GENERAL ANALGESIA; "SPINAL" ANAESTHESIA; RESPIRATORY PARALYSIS; FALLACIES AND METHODS*

BY

W. HOWARD JONES, M.B., B.S.Lond.

SENIOR ANAESTHETIST TO CHARING CROSS HOSPITAL

The title of this paper comprehends all the results obtainable on the nervous system by the injection of analgesic substances within the sub-arachnoid space. It includes nothing which was not observed as a result of the earliest employment of cocaine, but the interpretation of the results over the intervening period has been clouded with error, copied from one textbook or paper into another, and persisting in some of the latest publications. The basis of understanding is anatomical and physical.

ANATOMY AND PHYSICS

"The arachnoid membrane is a gauzy reticulum of almost web-like delicacy which in reality pervades the space it occupies. Its outer surface, or that closely related

* Read in opening a discussion in the Section of Anaesthetics at the Annual Meeting of the British Medical Association, Leicester, 1931.

to the dura mater and bounding the sub dural cavity, alone shows a sufficiently organized structure to merit the name of a membrane This quickly grades into a loose, spongy reticulum which pervades the thick sub arachnoid cavity throughout, and the strands of which are directly continuous into the more compact tissue of the pia mater This sponge like arachnoid tissue holds the cerebro-spinal fluid of the sub arachnoid cavity, the meshes of the sponge constituting a reticular web of intercommunicating spaces The cranial sub arachnoid cavity is larger and the strands of the web are relatively more abundant than in the spinal canal' (Morris)

The spinal sub arachnoid cavity passes up through the foramen magnum and enlarges into the cisterna magna, which is posterior, and in the dorsal decubitus dependent, and into the cisterna pontis and the cisterna basalis, which are anterior, more elevated, and contain the cranial nerve roots The sub arachnoid space surrounds the entire brain stem, and the roots of all the nerves in the body pass through it In this situation they are bare of fibrous sheath and therefore easily affected by analgesic solutions The sensory root of the fifth cranial is the largest and most compact in the body, but the spinal roots have their constituent fibres spread out into a fan like arrangement of entry and exit from the cord Those of the cervical and lumbar enlargements supplying the limbs are more bulky than those of the intervening thoracic nerves The lowest roots of the conus medullaris are centrally placed in the cauda equina and are overlaid by the higher trunks of the leash As these higher lumbar nerves escape through their foramina, the lower become more isolated and exposed The pia mater spinalis consists of two layers, the outer fibrous, and between them ramifies a rich plexus of blood vessels The dentate ligaments support the cord in its central position but do not effectively divide the space into an anterior and posterior compartment The reticulate formation of the arachnoid, the structure of the pia mater and the vascularity of the intra dural contents, the superficial area of which is relatively very great, are factors of prime importance which determine the distribution of soluble injected substances

The cerebro spinal fluid is secreted by the choroid plexuses and passes through the medial and lateral foramina of the fourth ventricle into the cisterna magna, whence it is distributed over the brain and cord The secretion of fluid can be very rapid, and it is probable that when a large quantity is withdrawn it is rapidly replaced The absorption of additional fluid injected is also very rapid, and because of the great vascularity of the lining membranes and the large surface area, the absorption of foreign chemical substances into the blood is only second in effectiveness and rapidity to direct intravenous injection, the rate of absorption being proportional to the concentration, and decreasing progressively as this becomes lowered Though it is impossible to imagine complete stasis in any living body fluid, there is not in the spinal canal any movement which can be called a circulation which would effect the immediate distribution of drugs injected Waves of condensation and rarefaction are communicated to the fluid by the respiratory and cardiac impulses which may have some effect over a more prolonged period The specific gravity of the fluid is not constant, but varies between 1 004 and 1 010 The movement of injected solutions is determined by their relative weight The sinking of a hyperbaric fluid in one which is relatively hypobaric is determined by a difference so delicate that an estimation of the difference would be impossible by any coarse method If the surface layer of water is cooled it sinks to the bottom of the container, or if the bottom layer is warmed it rises to the top Thus a hypobaric injection moves only when the heavier cerebro spinal fluid can descend from above and displace it upward The rate of movement will depend on the degree of difference between the specific gravities of the two fluids and the angle which the spine makes with the horizontal The behaviour of solutions injected into the sub arachnoid space is modified by the anatomical contents, and the ab orptive surface to which they are exposed

FALLACIES

The experimental work of Corning and its clinical application by Bier and other subsequent workers is described in most textbooks on the subject but it is noteworthy that operations on the head and neck were performed under this method early in its history, long before Barker experimented in this country This is not surprising since the moderate Trendelenburg position has always been thought necessary to ensure a good blood supply to the medullary centres and some of the solutions then used were among the heaviest ever employed while cocaine was used in dosage not thought permissible to-day It was this extension of the analgesia to the head, and a high mortality rate, which proved so alarming to the early workers, who had an abiding fear of the direct action of the drug on the medullary centres and stimulated Barker to try to devise a method whereby the effect could be controlled to the lower regions of the body Barker demonstrated that the drug could not spread upward by a process of simple diffusion, a *fact which is indisputable*, and by injecting relatively heavy solutions into glass tubes shaped to the curve of the spine and containing saline solution, he showed that unless the inclination was too great the solution descended to the lowest part of the dorsal curve and 'here it would remain more or less undiluted in contact with the structures around

These glass tube experiments have been the origin of much misconception because there is no clear run down for the solution in the body, nor do they represent the rapid absorption by the tissues and into the blood which is such an important feature *in vivo* They also give the impression that the dose descended in concentrated form to a certain level of the cord where if held long enough it became fixed' by the nerve tissue Barker refers to the action of the drug on the roots, but writes more frequently of the cord, suggesting that he was not clear on this point The term 'fixed' is very inapt, because a very large portion of whatever drug is injected is rushing round the body in the circulation until it is either excreted or destroyed Remembering that before Barker's time the saline and other solutions were said to "diffuse" into the neck, and that analgesia of the whole body was obtained it is not surprising to find that his heavy stovain glucose solution, S G 1 030, controlled by dosage and posture to the dorsal region, came to be known as 'indiffusible' and the saline solutions as "diffusible"

This in spite of the fact that the 'diffusible' Chaput solution, S G 1 080, was heavier than anything Barker subsequently employed Arising from this muddle is the fallacy prevalent in our textbooks to day that mixtures containing glucose are heavy solutions and saline solutions "light' solutions Gwathmey' states that solutions of lighter specific gravity than the cerebro-spinal fluid are generally called diffusible, whereas those of heavier specific gravity are called non diffusible Actually 10 per cent novocain in distilled water S G 1 017, is a heavy solution Another error prevalent in America and sponsored by Labat' is that when cerebro- pinal fluid is the solvent of novocain crystals no spread by gravity will take place in the Trendelenburg position It is impossible to add anything soluble to the cerebro-spinal fluid without increasing the specific gravity of that portion of it which happens for the time being to be solvent Assuming a fluid of S G

1.006, then a 10 per cent. addition of novocain crystals will raise the S.G. to 1.023. Addition of 250 mg. to 10 c.cm. of fluid will raise the S.G. to 1.010, and will operate in precisely the same manner as that amount of 2½ per cent. novocain in normal saline and will be subject to gravitational diffusion. The large volume of the low concentration will move just as effectively, though at first more slowly, as the small volume of the high concentration.

SPINOCAIN AND DUROCAINE

The addition of alcohol to a solution to make it lighter, attempted by Babcock in 1909 and patented by Dr. Pitkin nearly twenty years later, serves only to effect a temporary reduction of specific gravity after injection. The two mixtures spinocain, S.G. 1.005, and durocaine, S.G. 1.002, appear to respond to a variety of different treatments. An expansion of the solution over the thoracic nerve roots is said to be effected by an addition of cerebro-spinal fluid of anything between 1 and 10 c.cm. in volume without regard to the length of the spine. After injection, some tilt the table into the head-up position and others into the Trendelenburg. For the past two and a half years incomparable analgesias have been claimed in the dorsal decubitus, but recently both administrator and patient have made a *volte face* and the ventral position is adopted. A viscous substance called gliadine, 0.00325 gram per c.cm., is said to delay absorption and to prolong analgesia, but the dosage has coincidentally increased beyond anything previously heard of. One claims constant complete abdominal analgesia in the up-tilt lateral position in 1 minute 25 seconds, another that it may be delayed as long as 47 minutes. These fall into a separate system known as "controllable spinal analgesia." One observer has asked, "After all, does controllability matter?"

The explanation of the fallacies underlying the administration of these solutions is a very simple one. The ingredients fall into two distinct classes, volatile and non-volatile. The low specific gravity is due entirely to the volatile member. The rate of absorption into the blood of a volatile substance is out of all proportion more rapid than that of a non-volatile substance. If spinocain were floated on to the surface of a warm saline, the alcohol would evaporate into the air, and the novocain would be dissolved in the saline. When injected into the sub-arachnoid space and mixed with cerebro-spinal fluid, the specific gravities of the two fluids become averaged, and the mixture only slightly hypobaric. The rate of upward displacement would therefore be slow and progressively retarded by further mixture with heavier fluid. The "air bubble in a spirit level" arrangement is possible only between two media which are not miscible. The rate of absorption of the volatile alcohol will be far more rapid than the non-volatile novocain, and the solution quickly passes through an isobaric stage and becomes hyperbaric. The end-result is always novocain dissolved in cerebro-spinal fluid. The one constant feature in the ritual of these administrations is the Trendelenburg position.

The dosage of novocain is so high that the amount absorbed into the blood causes a general analgesic state, and the itching, drowsiness, and stupidity of the patient which has been described by various observers[5] is evidence of the action of the circulating drug on the sensory nerve endings in the skin and on the cortical cells of the cerebrum. When the Trendelenburg position is adopted immediately after injection the solution hangs until the alcohol has been absorbed, when gravitational diffusion commences. All the novocain absorbed into the blood before this begins serves only to poison the patient and effects no useful purpose. In consequence, the dosage sometimes used is more than double that necessary for the production of analgesia by a more rational method.

GRAVITATIONAL DIFFUSION

The process of diffusion by gravity in the body differs from the descent of a heavy fluid *in vitro*, because of the meshwork of baffles which the solution encounters, resulting is more and more mixture with the lighter fluid, and the fact that the drug is all the while being rapidly extracted into the blood and by the nerves. Thus absorption and dilution result in progressive diminution of specific gravity and a progressive slowing of the movement, which is also limited in the horizontal position by the curve of the spine. In the Trendelenburg position the effect of gravity is not to move the dose in high concentration to the most dependent part, but to spread it out in ever-decreasing concentration over a distance which will be proportional to the amount of drug injected, and as more butter is required to spread a large piece of bread than a small one, so more drug is required to spread a long spine than a short one, a factor which has never been considered. The body weight is important in relation to blood dosage, a fact which is apparent when considering the high relative dosage and frequent development of sleep in children, reported from the earliest period to the present day.

The dentate ligaments no doubt have at first some directing action in supporting and spreading the solution over the anterior roots, but it always tends to sag and give the greater concentration to the posterior roots, especially in the higher regions. When the high tide of effective concentration reaches well above the centre, then both anterior and posterior roots receive the drug; when it sinks below the centre, then only posterior roots are affected. This result, together with the fact that with moderate dosage only a low concentration reaches the neck, explains how the motor roots of the phrenics and upper intercostals can carry on when the head is analgesic. Analgesia always extends higher than paralysis, and the upper segments of the abdominal muscles may be imperfectly relaxed with absence of pain sense at the same and at higher levels. The arms are not paralysed even in the highest analgesias by this method. The graded effect of all analgesics on mixed nerves has long been known both experimentally and clinically. Pain sense is the first to go, then follow touch, muscle sense, and finally motor power. Return is in the reverse order, and a leg may be operated on long after movement has returned. If the injection is dilute, short analgesia is developed without loss of power. The size of a nerve root or trunk also determines the effect of a particular concentration of drug. Gravitational diffusion is an inaccurate method, wasteful of power, and uneven in distribution, for if the drug wanders beyond its intended area, loss of concentration results where it is most needed. But although moderate doses of novocain spread by gravity into the neck may not paralyse respiration, they undoubtedly impair the activity of the centre and the conductivity of the motor roots of the phrenics and intercostals in proportion to the concentration which each receives, the one through the blood and the others directly, for the respiration under high blocks is often reduced to a minimum.

KOSTER'S THEORY AND EXPERIMENTS

There has lately been some attempt to reintroduce this method for operations on the head and neck, and the name of Koster of America has been prominent in this connexion. Koster[4] exposed the medulla and upper cervical cord in frogs and guinea-pigs and applied novocain solution direct to this region. He records that the animals became analgesic all over and that they also became somnolent. He also applied solution to mixed nerve trunks in order to demonstrate that sensory fibres are more easily affected than motor, a fact which was already known. He deduced from these experiments that the strength of novocain which was

effective in interrupting the sensory conduction paths in this region did not affect the respiratory centre because this is a motor mechanism and therefore not so easily affected. He also states that the somnolence was due to diffusion of novocain to the cortex. Applying these results to human beings he propounds the theory that all past fears of paralysing respiration have been groundless, and all that is necessary is to keep the patient's head low in order to ensure a good blood supply to the medullary centres. All administration in the human being has until recently been by means of hyperbaric solutions. The anterior root block seen under hypobaric solutions of percaine revealed definite proof that the action of the analgesic is not direct into the cord but only on the roots, for it became evident that the motor side could be paralysed when the sensory fibres were left free. This disposes of the theory that muscular relaxation is due only to lack of stimulus, and suggests that the pia mater is impervious to analgesics; it should also be remembered that the spinal pia has a fibrous layer. Koster's experiments depend on the direct action of the drug through the pia mater into the conduction tracts. Before applying novocain he determined that the lumbar reflex arc was intact by stimulating the skin of the leg. After a presumed transverse section of the sensory conduction paths by novocain, he states that the animals became analgesic all over and that stimulation of the legs produced no response. Now 1 per cent. novocain injected up the spine of human beings will paralyse motor fibres of the anterior roots, but Koster states that a 2½ per cent. solution applied to the medulla of these animals did not. Is it not obvious that this strength never reached the motor mechanism in this region? Did it reach the sensory tracts? Assuming that it did, what abolished the reflex arc in the lumbar region, for no novocain was applied here, and it could not have run down to the lumbar roots because the animals were in the Trendelenburg position? Was this due to central motor inhibition? Is it not possible that the animals were analgesic and somnolent from blood absorption? Whatever the explanation may be the experiments were based on a fallacy, and provide no material evidence whatever for a generalization applicable in our operating theatres. One case of respiratory embarrassment on the operating table is worth a thousand such experiments.

RESPIRATORY EMBARRASSMENT AND COLLAPSE

The danger in intra-thecal administration is not a vaso-motor effect from a regional block of the thoracic and lumbar roots, which proves to be of much less significance than was formerly thought, but from blood absorption and paralysis of the vaso-motor centre, leading in some cases with excessive dosage to severe collapse to a pulseless state. The nausea and vomiting which sometimes occur after injection, apart from surgical manipulation, is similarly due to stimulation of the vomiting centre by the poison, as well as low blood pressure. This may be realized by injecting the full contents of a spinal ampoule into a muscle. It is not to be expected, therefore, that the respiratory centre will escape entirely, and the degree to which it may be affected will depend on the amount of the dose in relation to the body weight of the patient. The effect on the cortex shown by the drowsiness and tendency of the patient to sleep also depends on the amount of the drug circulating in the blood. The zenith of blood content is probably reached about 15 to 20 minutes after injection by the gravitational method, and a little earlier by the direct method, because of the larger absorptive surface to which the drug is immediately exposed.

Cushny[3] states that the relative non-toxicity of novocain is due to the fact that novocain is destroyed by the liver and cocaine is not. The slow absorption from infiltrations, especially with adrenaline, gives the liver time to deal with the poison, but when novocain is injected intravenously the toxicity more nearly approaches that of cocaine. On account of the rapid absorption of spinal injections their toxicity must be reckoned as only less high than those administered intravenously. If the dosage is high and the body sloped, a variable concentration will reach the anterior roots of the phrenics and intercostals and reduce their conductivity in proportion to the concentration, and the respiration becomes shallow and slow. Anoxaemia will further reduce the centre and increase a tendency to sleep, for it is a powerful, and our last, anaesthetic.

The respiratory centre may therefore be paralysed by an overdose of the drug in the blood, or by a combination of reinforcing agents of which the analgesic and a preliminary narcotic may be the cause. If the centre is badly fatigued and poisoned by drugs it may be difficult to keep it active, whatever means may be adopted. An overdose of percaine whether by infiltration or by intra-thecal injection will paralyse the centre, and a competent hypobaric solution injected into the neck will paralyse the phrenics and intercostals. Koster states in relation to the human subjects, "In many patients, particularly in children, when head anaesthesia is induced by encouraging diffusion of the drug upward to the medulla, it is found that sleep results." This appears to have been the experience through the history of the method from the earliest cocaine days, and is but due to the fact that the dosage has been relatively high in children compared with body weight. This sleep has also been ascribed to the complete isolation of the consciousness from all body stimuli: a mind deprived of body sensation, yet capable of that most potent of all experiences, fear, and falling asleep on the operating table out of sheer boredom from want of stimuli. To produce general analgesia, all that is necessary is to inject a sufficient dose of novocain in the lumbar region, thereafter inclining the body in the Trendelenburg position. This spreads the drug over the nerve roots, at the same time exposing it to an enormous absorptive surface. The general effect on the patient may be profound. Koster admits that in some cases a peripheral pulse is not be expected, but implies that this is no disadvantage, since the surgeon can always refer to the aorta, a consolation not available to the specialist in anaesthesia. This condition almost resembles a state of suspended animation, and I have remarked that the patient is "hibernating." And so it seems. Every function of the body is depressed to its lowest level: no pulse can be felt or, when palpable, may be reduced in rate as low as 30 to 40 per minute. The conductivity of the phrenics is reduced and respiration is just sufficient for life. A short period of sleep may be observed and the lips and cheeks may puff out as they do under chloroform.

There are two components at work, a regional nerve root block and a blood dose of novocain. To what extent the cranial nerve roots are directly involved is an interesting question. In the dorsal decubitus the novocain will first be directed towards the cisterna magna, and from here it may spread over the base of the brain, but the arachnoid reticulum is here at its densest and the amount of fluid far greater than it has already encountered in the spine. In such high dilution the novocain has to attack the largest and most compact sensory root in the body.

Is it not probable that an amount of novocain injected in the lumbar region, capable of spreading the sub-arachnoid space as far as the fifth cranial roots, may also be capable of producing general analgesia apart from nerve block, if not actually general anaesthesia?

Dickson Wright[4] is an enthusiastic advocate of spinal injections for operations on the head and thorax, but says

that "shallow and slow respirations may be worrying." He records a respiratory rate of six per minute, and says, "The patient was asleep and I did not care to wake her to tell her to breathe faster." When admonition is inapplicable, carbon dioxide and oxygen are indicated. The outstanding clinical features of such cases are a reduced frequency and amplitude of respiration, and very low blood pressure, sometimes reaching a pulseless state. The one means imperfect lung ventilation, and the other a reduced rate of blood flow through the lung capillaries. Both tend to anoxaemia and a vicious circle which may end in an arrest of respiration, and it is no recommendation to claim that the majority survive.

JONNESCO'S PRACTICE

Jonnesco's practice was based on the fallacy of direct medullary action, and on the principle that strychnine injected with the drug stimulated the centre and kept it active. Strychnine has no action on nerve fibres, and to reach the cells of brain or cord must first be absorbed into the circulation. But cells paralysed by an analgesic would not respond to stimulants, nor would the latter avail to stimulate cells whose conducting fibres were blocked. Nothing but the possibility of damaging the cord prevents Jonnesco's puncture between D1 and D2 from being a practical method. Short analgesias in the area of the cervical nerves could be obtained by injecting small volumes of dilute solutions, and the motor roots of the phrenics and some of the extraordinary muscles of respiration would have their conductivity reduced but not abolished. To gain longer analgesias stronger solutions would be required which might paralyse the phrenics and some extraordinary muscles, leaving the intercostals to carry on respiration. But the rigid chests of old people would be a bar to such a procedure. It follows therefore that only short analgesias would be advisable by this method. Dilute solutions can be injected up from the lumbar region, but the large volume required means more drug for blood absorption. There must be a very dilute solution of percaine which could be operated in this manner, but what the strength is I cannot say at the moment. The 1-1,500 strength would paralyse the phrenics, and must not be injected into the neck.

Clearly separated from the foregoing is that kind of administration which is intended for abdominal and lower operations, the acknowledged territory of what is generally known as spinal analgesia. Such administrations have in the past frequently passed intended limits, and merged into general anaesthesia, from want of interpretation of the factors involved. This division comprises two subdivisions which require different treatment, limited thoracic nerve root block, and intra-dural caudal block.

LIMITED THORACIC NERVE ROOT BLOCK

Splanchnic block for abdominal surgery requires that the drug shall pass the roots of the 4th or 5th thoracic nerves. Between these and the 4th cervical roots is a sufficient interval to give a wide margin of safety. There are only two possible ways of spreading an analgesic over the roots from the lumbar region:—

(1) Gravitational diffusion, which can be limited only by dosage and a moderate angle of the table, and gives an uneven distribution.

(2) By manipulating a syringe:

(a) Using cerebro-spinal fluid; simple addition of drug is followed by gravitational diffusion.

(b) direct injection of foreign fluid charged with the drug; if this is hyperbaric gravitational diffusion follows; if it is isobaric or hypobaric no spread follows in the Trendelenburg position.

The adult spine is most variable in length. Measurements in my series of cases from the inter-iliac line to the 7th cervical spine with the body in full flexion have varied between 16 and 22 inches, and both shorter and longer probably exist. In addition, the cubic capacity of the dura in women must be reckoned as rather less than that in men.

The Method of Barbotage or Replacement

This is the method of withdrawing the cerebro-spinal fluid and adding the drug to it before reinjecting. This is impracticable with novocain, because a hyperbaric solution is always produced. Percaine may be used up to 3 c.cm. of 1 in 200 dissolved in acidulated distilled water. This will produce an approximately isobaric solution, and will apply equal concentration to both anterior and posterior roots. Analgesia will therefore outlast abdominal muscular paralysis, but relaxation will be good. The amount of fluid withdrawn must be proportioned to the length of the spine, otherwise no constant nerve root level can be expected. The disadvantages of this method are that the withdrawal of a large quantity of fluid is tiresome and not always successful with a fine needle, and the addition of so small a quantity of acid fluid to a large quantity of alkaline fluid may result in the precipitation of the percaine. Quarella,[9] who favours this method, regards scopolamine and morphine as an essential part of the technique, and it may be that this is because the level of root block is not always what has been aimed at, for how can it be constant if the spine has not been measured?

The Method of Direct Injection

This means the injecting of a dilute hypobaric of the drug without withdrawing cerebro-spinal fluid. This is the simplest method, a full account of which has been given elsewhere.[10] To calculate the volume of fluid required to pass the 5th thoracic roots, take a measurement from the inter-iliac line to the 7th cervical spine with the body in full flexion; from the number of inches recorded deduct 4 for men, and 6 for women; this result indicates the number of cubic centimetres of solution to inject between L1 and L2, or L2 and L3. This formula is put forward as a basis for a moderate increase with experience, and as a reminder that women require rather less than men. If the operation is pelvic the injection should be made between L4 and L5 in order to hit the lowest nerves in their most exposed situation. For gynaecological operations 10 to 12 c.cm. should be ample.

In the dorsal decubitus a hypobaric solution tends to apply itself in greater concentration to the anterior roots, and in some cases may give abdominal muscular paralysis and no analgesia. In the lateral position, a unilateral effect is produced, a result of importance, because the upper affected side is at the disposal of the surgeon. The degree of this separation depends on the amount of the difference between the specific gravities of the two fluids, and the rate of injection. To produce this effect in the lateral position, make a slow injection, for the more rapid the injection the better the mixture of the two fluids. To ensure analgesia, the patient must be put in the ventral decubitus after injection for from 5 to 10 minutes; the duration of the analgesia will depend on the time spent in this position. If in any case this position seems inadvisable, the two lateral may be used consecutively. It will be found that, as a result of the continued action of the drug on the anterior roots when the patient is put on the back, the paralysis of the abdominal muscles will probably outlast the analgesia. The nearest approach to an ideal drug for this method yet produced is percaine, because it is capable of producing a prolonged effect on nerve fibres in such high dilution that the rate of absorption into the blood is very slow. A rapid general toxic effect is thus avoided. It may be used in strengths of

1 1,000, 1 1,500, and 1 2 000, dissolved in acidulated 0 5 per cent saline (S G 1 0034) The normal saline solutions, S G 1 006, are midway between possible variations in the specific gravity of the cerebro spinal fluid By this method sufficient acid fluid is injected with the percaine to keep it in solution

The latest fallacy to arise is that "percaine gives such marvellous relaxation" The perfect and lasting relaxation is due to the method of administration whereby the powerful drug is efficiently applied to the anterior roots It is correct to say that isobaric and more especially hypobaric solutions give good relaxation, and that hyperbaric solutions spread by gravity tend to give poor relaxation in the upper segments of the abdominal wall Thus a percaine glucose solution would have this defect In spite of this profound regional root block the fall of blood pressure after percaine injections, though occasionally smart, is never so severe as after massive doses of novocain, nor is toxic vomiting and pallor so much in evidence Novocain may be used in this way 1 per cent dissolved in 0 25 per cent saline, S G 1 003, or in 0 5 per cent saline, S G 1 005 If 1 per cent in normal saline is used, S G 1 0077, the patient may be kept horizontal in the dorsal decubitus until absorption has reduced the specific gravity, and both roots should be fairly evenly affected The strength of these solutions may be increased in proportion to the faith of the user in the non toxicity of this drug When higher percentage is used sodium chloride must be left out proportionately to preserve the required specific gravity of the solution The strength limit in which novocain can be used as a certain hypobaric solution is 2 per cent in distilled water When dosage becomes high, blood absorption will dominate the picture

LIMITED INTRA DURAL CAUDAL BLOCK

Intra dural caudal block requires different treatment from that of thoracic root block because the nerve trunks are more resistant than the roots The 1 in 1,500 percaine solution when completely effective in the abdominal area sometimes leaves some power of movement in the legs, and deep sensation, showing that the lumbar nerves are more difficult to affect both in their roots and trunks than the thoracic For limited caudal block, stronger solutions are therefore required The novocain and stovaine solutions in common use always hit the cauda equina in their strongest concentration, and the most profound effect is in the legs and perineum, but the only way they can be limited is by sitting the patient up after injection Limited block in the horizontal position requires an isobaric or a hypobaric solution Percaine dissolved in acidulated distilled water or 0 5 per cent saline may be used in strengths from 1 in 100 down, and the amount of drug need never exceed from 5 to 10 milligrams Thus ½ to 1 c cm of 1 100, 1 to 2 c cm of 1 200 and so on Six to eight hours duration of analgesia is possible with this drug, but such prolonged effects are doubtful practice A great variety of strengths may be used, the object being to effect a good local mixture with cerebro spinal fluid at the site of puncture When the operation is on the leg the barbotage must be sufficient to spread the drug on to the first lumbar nerve, or higher according to the site of the operation The duration of analgesia will depend on the amount of barbotage used and the dilution attained in the cerebro spinal fluid Novocain up to 4 per cent in distilled water may similarly be used

GENERAL CONSIDERATIONS

One of the most prevalent fallacies used to be that spinal analgesia is a method to be used when the patient is in too low a condition to take a general anæsthetic and a common utterance was "He is too bad for a general better give him a spinal," and this in relation to serious cardiac disease It hardly seems necessary to condemn the administration of massive doses of novocain, with the possible severe fall in blood pressure, when the mechanical efficiency of the heart and the state of the myocardium is defective A profound fall in blood pressure means a reduced coronary circulation, and only a sound heart can be submitted to such an ordeal It is certain that ephedrine cannot be relied upon to prevent fall of pressure, though it may alleviate it It should be injected into a muscle or into a vein and not into the fibrous tissue of the intervertebral ligaments, where absorption must be slow A limited caudal block or a block of a few thoracic roots may be undertaken when a more extensive effect would be inadvisable and it is necessary to distinguish clearly between the risks involved in low and high operations since the necessities of dosage and the vaso motor effects are greater in the latter The advent of percaine undoubtedly extends the use of this method in poor risks and the 1 in 2 000 solution will accomplish much in short abdominal interventions with very low general toxicity But this drug will not confer immortality on anyone High thoracic root block finds its best application in the muscular man about to undergo a gastric operation who would otherwise require a harsh general anaesthesia to bring him into a good state of relaxation

My own outlook is This man is too strong for a general better give him a spinal For normal people spinal analgesia may be offered as an alternative to anyone who wishes to avoid general anaesthesia, and its advantages in lung disease, especially tuberculosis and other pathological conditions are well recognized But because in bad risks spinal analgesia has disadvantages of its own it does not always follow that its use is excluded in such cases for the post operative risk of general anaesthesia may be even worse The temporary stimulation of ether may be the most certain way of getting a patient off the table alive but the subsequent depression may yet be disastrous and it cannot be expected that an anæsthetist shall devote the whole of his experience to avoiding the coroner's court and qualifying his patient for a death certificate

For such judgement as may be required in these cases no rule can be made For operations on the head and neck this method cannot compare in regard to safety with a well planned sophisticated gas anaesthesia by intubation methods, or a two way insufflation of ether In operations on the thorax when a mechanical difficulty in respiration already exists I believe no valid argument can be found in its favour, though a unilateral effect with 1 in 2,000 percaine may be of service for an operation on the lower chest wall In relation to its employment for such operations as dissection of tonsils after injection of massive doses of novocain in the lumbar region I am reminded of the criticism attributed to Dr Johnson when shown a little dog walking on its hind legs Sir to be sure it is done, but it is not well done, the marvel is that it can be done at all"

MILK-BORNE STREPTOCOCCAL INFECTIONS*

BY

E. WILKINSON, F.R.C.S., D.P.H.

LIEUT.-COLONEL I.M.S. (RET.)

In these brief notes on milk-borne streptococcal infections I propose to deal only with those of scarlet fever and sore throat.

That milk may be a vehicle of infection has long been established, and, although the recognition of streptococci as infective agents followed much later, so much work on the subject has been done during the last twenty years or so that it is now possible not only to classify strains of this organism as of human or bovine origin but to identify many of the strains concerned with individual cases of illness.

Milk outbreaks, whether due to streptococcal or other infections, have certain well-known characters, such as their sudden, often explosive, onset; the almost precise limitation of attacks to the consumers of a particular milk; the special incidence upon classes who can afford, or upon persons who drink, most milk; the persistence of attacks as long as the infected milk is used, and their sudden cessation upon its disuse or sterilization. While such characters are common to all epidemics dependent upon milk-borne infection, the outbreaks themselves may vary greatly in their duration, extent, and severity, from a few cases of mild scarlatina occurring in a few days in houses served by a single roundsman to a widespread epidemic, lasting several weeks, of attacks of serious illness with considerable mortality.

TWO RECENT OUTBREAKS

I have recently been concerned with two milk-borne outbreaks of disease, both in this part of the world, and both presenting what may be considered the classical characters of such outbreaks, but which differed from each other considerably in many ways. They serve, I think, as illustrations of two different ways in which infective organisms may gain access to milk—namely, by direct contamination by some person handling it or indirectly by the proliferation in the udder of the cow of organisms derived from a human source. One of the outbreaks was of scarlet fever, the other of streptococcal sore throat.

I

In the scarlet fever outbreak some 66 persons were attacked in 10 days, 44 of the cases being attacked on the fourth and fifth days of the outbreak. The cases were promptly notified, and at the same time a number of persons, estimated at about 100, were reported to have suffered from sore throat. Two deaths occurred, both of elderly patients, one a sufferer from scarlet fever, the other from sore throat. All these persons were consumers of either milk or cream from a certain dairy. On the sixth day of the outbreak two members of the dairyman's family were segregated, and from the sixth to the tenth day the milk was boiled, and no further cases occurred. The dairyman concerned supplied some 65 gallons of fresh, unpasteurized milk daily to about 300 customers, chiefly in a residential area. Most of the milk was delivered in bottles, but some into customers' jugs, and there was also a small counter trade in milk and cream. The dairy was an old-established one with a good reputation, and its premises, which included a milk shop, were clean, and there was a good supply of both hot and cold water in the shed in which the milk vessels were cleaned and stored. This shed was in direct communication with the dwelling-house.

The dairyman and his wife were elderly people apparently in good health, who had little to do with the milk. With them lived their grown-up son and daughter, the son being one of the roundsmen employed in the business, and the daughter serving in the milk shop. The son, when seen on the sixth day of the outbreak, said that his throat had been rough for a few days, but that, except for this, he was, and had been for a long time, quite well. Because of this "rough throat" he was ordered to have nothing to do with the milk, and three days later he went to stay with friends at a distance. On this day the daughter, who had been slightly unwell the previous day, developed scarlet fever, and was immediately isolated. The son returned from his visit 18 days later, but, as he was then desquamating, he was at once taken to the isolation hospital. This desquamation is of interest because, according to the statements of the man himself and others, including medical men who saw him on several occasions, he never had a rash. Swabs from the throats of several of the patients, including the dairyman's daughter, examined just as the outbreak ceased, showed the presence of haemolytic streptococci of scarlatinal type II. On the return of the son his throat, as well as those of his parents and all the personnel of the milk business, were swabbed. The swabs from the dairyman and the son yielded haemolytic streptococci of the same type as that previously obtained from patients; those from the rest of the personnel were negative. It will thus be seen that haemolytic streptococci of scarlatinal type II were obtained from the throats of certain scarlet fever patients, of a man who had a sore throat, and who desquamated, but was not known to have had a rash, and from another man who presented no sign of either scarlet fever or sore throat.

The dairy obtained its milk from two farms, and careful inquiries made at both failed to disclose any circumstances affecting either their personnel or their cows which might account for the infection of the milk.

The dairyman's son would seem to have been the source of infection of this outbreak. In its early stages he was suffering from a "rough throat," later he desquamated, and the swab then taken from his throat yielded haemolytic streptococci of the same type as that recovered from the throats of scarlet fever patients. Moreover, this man had had more to do with the milk than anyone else. He received it on its arrival and poured it from the farm churns into the dairy storage churns. He bottled the milk received in the evenings for the next morning's delivery, and on arrival of the morning's milk from the farm poured most of it into delivery churns for the second round. He also had a milk round, though a small one, and it is significant that, although he delivered milk at only 47 houses, cases of scarlet fever occurred in 20 of these houses, as compared with 29 of the 236 houses served by the two other roundsmen; thus, while cases of scarlet fever occurred in 12.2 per cent. of the houses served by the two other roundsmen, such cases occurred in 42.5 per cent. of the houses at which the dairyman's son delivered milk.

II

The other outbreak to which I have referred, that of sore throat, occurred among the same large urban population, but at an interval of about a year. As sore throat is not a notifiable disease, some time elapsed before its presence in epidemic form was recognized. Attacks were spread over about a month, during which members of over 1,000 families were affected, and 65 deaths occurred. The primary illness was in most cases follicular tonsillitis, often severe, and this was in many instances accompanied, or followed, by complications, mostly of a septic character. Relapses were common. Some of the earlier patients were thought to have "influenza throats," while others were

* Read in opening a discussion in the Section of Pathology and Biochemistry at the Annual Meeting of the British Medical Association, Eastbourne, 1931.

suspected to be suffering from diphtheria, and many swabs were sent to the municipal laboratories for examination for Klebs-Löffler bacillus. The swabs, however, yielded not K.L.B., but streptococci, and inquiries then made led to the discovery that all the patients were consumers of milk from a particular dairy. This was a large dairy distributing some 1,500 gallons of milk daily to some 6,000 consumers, chiefly of the well-to-do classes. Except that it had no pasteurizing plant, the dairy was exceptionally well equipped with modern dairy appliances. It had an excellent reputation, and was very clean. Up to the time of the inquiries no suspicious illness had occurred among its personnel. Its milk was obtained from a number of local farms, the churns from which were emptied into large mixing tanks on arrival, and, after being clarified, the milk was bottled mechanically for distribution. On a certain morning some weeks after the earliest cases had been attacked, a sample of the milk from each farm was taken on its arrival at the dairy and was examined microscopically at the municipal laboratory. One of these samples was found to contain abundant streptococci, and on the use of this milk being stopped the epidemic ceased. Inquiries were then instituted at the farm at which this milk was produced. It was found to be a model of its kind; the cowsheds were modern buildings, well lighted and ventilated, kept scrupulously clean, and provided with ample supplies of hot and cold water. The cows were groomed daily and milked mechanically, and all the milk, except a little used locally, was sent every morning and evening in sealed churns to the dairy. The farm was in charge of a resident bailiff, who, about two months before the outbreak of tonsillitis, had been in hospital for appendicitis. On his return a few weeks later he found some of the cows suffering from mastitis, and from then onwards certain other cows suffered from inflammatory conditions of the udders, leading to the removal of some of them from the herd. Three cows had been removed a day or two after the streptococci were discovered in the milk from this farm.

Except for the bailiff's appendicitis there had been no recent illness among the personnel of the farm prior to the epidemic of tonsillitis among the dairy's customers, but almost simultaneously with the earliest of these cases similar cases had occurred in the bailiff's house and in a cottage which communicated with it and, somewhat later, in the family of one of the milkers. Cases continued to occur among the personnel of the farm for some weeks, the bailiff himself being one of the later patients to be attacked. The patients at the farm, like those in the town, suffered from complications of a septic character as well as from relapses. Two of the attacks proved fatal.

In the course of inquiries after the cessation of the outbreak, swabs were taken from a number of patients, then mostly convalescent, both from among the dairy's customers and the personnel of the farm, and some of the swabs from patients of both groups yielded haemolytic streptococci, which were also isolated from some of these same patients several weeks later.

The streptococci conformed generally to the reactions of the common *Streptococcus pyogenes*, but had certain colonial and serological characters which permitted of their identification; their haemolytic properties were marked, as was also their virulence for mice. These characters agreed very closely with the description of organisms yielded by patients during epidemics of tonsillitis in America in recent years.

Several inspections of the dairy herd were made, and on at least one occasion milk from each quarter of every cow was bacteriologically examined. Haemolytic streptococci were recovered from the milk of many of the cows, only a few of which had clinically apparent mastitis. All the organisms were of the bovine type, and on no occasion were haemolytic streptococci of human type recovered from the milk. In this connexion it should be borne in mind that attempts to isolate streptococci of the human type from the milk were not undertaken until some time after the attacks of tonsillitis had ceased, and that in the meantime cows which might have been excreting such organisms may have ceased to do so or may have been removed.

AN AMERICAN OUTBREAK

Reference has been made to outbreaks of tonsillitis in America. Of these one of great extent and severity was that which occurred at Chicago during three months of 1911 and 1912 during which, it was estimated, some 10,000 persons were attacked.[1] The epidemic resembled in many ways the one I have just described, the clinical features of the attacks being almost precisely similar, and haemolytic streptococci of a somewhat special character were isolated from the throats of many of the patients. Infection was conveyed by milk from a certain farm at which certain of the milkers had been suffering from sore throat and certain of the cows from mastitis. Following this outbreak, Drs. Davis and Capps[2] conducted a series of experiments to determine whether haemolytic streptococci derived from human sufferers from tonsillitis were pathogenic for cows and "to determine possible avenues of udder infection through the teats." As a result of their experiments they found that while haemolytic streptococci of human origin could be applied to the uninjured surface of cows' udders and teats without causing infection, yet when applied to an injured or abraded surface of the teat or injected directly into the udder through the milk channels the organisms may proliferate enormously, and mastitis may be caused lasting for several weeks. Such mastitis may exist without physical evidence, though pus may be secreted in the milk as well as streptococci in enormous numbers for several weeks. The appearance of the milk may or may not be altered.

COMMENTARY

Although no haemolytic streptococci of human type were found in the milk in the recent English epidemic of tonsillitis there can be little doubt that they would have been found had the necessary bacteriological investigations been undertaken while it was in progress, for it has been seen that such organisms, with identical characters, were isolated both from the dairy's customers and from the farm personnel, between which, except for the milk, there was no possible source of infection exclusively common to both.

The extent and duration of the outbreak can hardly be explained except on the assumption that the milk was grossly infected for some weeks with organisms pathogenic to man, and that this can occur in the case of haemolytic streptococci of human origin is demonstrated by the experiments of Davis and Capps.

It will have been noted that the attacks among the dairy's customers and among the farm personnel were coincident, and this suggests that both were infected at the same time from the same source—namely, the milk. The source of the infection of the milk, while not definitely proven, is believed to be a prior case of similar illness occurring in a house a few miles from the farm which it was the bailiff's duty to visit daily, taking with him butter and cream. Some weeks previously an inmate of this house had suffered from an attack of sore throat which he had acquired elsewhere, and from which he suffered a relapse about a week before the first attacks of the outbreak. The bailiff did not milk the cows at his farm, but it was his duty to examine any which were not well. It has been seen that both during and prior to the outbreaks

of tonsillitis several of the cows at the farm had suffered from mastitis and other inflammatory infections of the udder, and it is thus possible that the bailiff may have conveyed to one or other of such cows the infection which in some way he had brought from the patient at the house he visited daily.

Incidentally, it may be mentioned that following the cases at the farm there was a small outbreak among the occupants of this house and that the doctor who treated patients both at the farm and at the house considered that all of them were of the same nature.

Both the outbreaks I have described, the one of scarlet fever and the other of sore throat, were due to haemolytic streptococci of closely allied though distinguishable types and in both the infection was spread by milk. While, however, the scarlet fever epidemic lasted only for a few days and the attacks, numbered by tens, were almost limited to persons served by a single roundsman, himself a carrier of infection, the epidemic of sore throat was spread over several weeks and the patients, numbering many hundreds, received their milk from many roundsmen, none of whom, so far as is known, was infected. The difference in the duration of the outbreaks is doubtless attributable, at any rate in part, to the circumstance that scarlet fever is notifiable, this permitting of prompt preventive measures, while sore throat is not. The difference in their magnitude, however, is only to be explained, I think, by the different ways in which infection was spread. The scarlet fever patients owed their infections, I believe, to the direct infection of the milk by the infected roundsman by whom they were served, while to account for the many hundreds of attacks of sore throat occurring among persons living in all parts of the area served by a large dairy, some gross infection of the milk must be assumed. It has been seen that when the milk from a single farm of the many supplying the dairy was discontinued the outbreak ceased, and it would thus seem that for this milk to have infected so many consumers, greatly diluted as it was with other milk before it reached them, it must have been grossly infected. Such gross infection of milk with organisms pathogenic to human beings is, I think, best to be explained, in the light of the experiments of Davis and Capps, by the infection of cows, already susceptible owing to the condition of their teats and udders, with organisms derived from a human source.

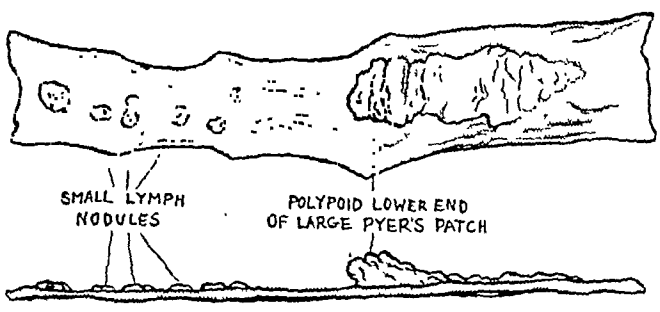
INTUSSUSCEPTION ILLUSTRATED BY THREE UNUSUAL EXAMPLES

BY

JAMES CROOKS, M.B.ED., F.R.C.S.ENG.

SURGICAL REGISTRAR, HOSPITAL FOR SICK CHILDREN, GREAT ORMOND STREET



Three cases of intussusception recently operated upon at the Hospital for Sick Children have certain points of interest. In the first I was able to discover the exact cause; in the second a recurrence was shown to have the same point of origin as the previous intussusception; and in the third, recovery followed intestinal resection and anastomosis in a baby aged 8 months.

CASE I

This baby girl, aged 6 months, provided an opportunity of obtaining a good specimen of bowel indicating the cause of the intussusception. As a rule the intestine of such of these children as come to the post-mortem room is gangrenous, and it is impossible to determine precisely the exact starting point of the intussusception by an examination of it. This baby, however, died twenty-four hours after operation from respiratory failure, the cause of which was proved by the necropsy to be mal-development of the diaphragm.

At the operation the apex of the intussusception reached half-way down the descending colon; on following it backwards the colon was found to pass under the right costal margin, so that the incision had to be prolonged upwards. The liver lay completely in the right side of the chest. The point of origin of the intussusception, which reduced easily, was six inches proximal to the ileo-caecal valve, and could be felt as a definitely localized and thickened patch in the bowel wall, of the area of a sixpenny bit. The surrounding gut was not obviously thickened.

The necropsy showed that the muscle of the diaphragm was absent, save for a few fibres in its left posterior part; the rest was solely represented by a thin complete fibrous sheet; this lay over the liver, which was herniated into the right side of the chest. The right lung was unexpanded and occupied only the apex of that side of the chest. The Peyer's patches in the ileum were large, and the thickening in the bowel wall corresponding to the starting-point of the intussusception was an almost polypoid hypertrophy of the lower end of one particularly big patch. This is well shown in the figure. There could be no doubt that this thickened part of the patch projecting into the lumen of the bowel had acted like a polyp in causing intussusception. The mesenteric glands were moderately enlarged.

Half-scale drawing of bowel of Case I. The upper figure shows the large size of the lymphoid patch, and the lower profile sketch indicates how it projected into the lumen.

CASE II

Operation on this boy, aged 6 months, revealed an intussusception which had reached the splenic flexure. Reduction was difficult, but the intestine was considered viable. The starting-point, which was unusually high, being eighteen inches proximal to the ileo-caecal valve, was indicated by a definite dimple, but the whole of the affected bowel was so oedematous that no localized thickening could be felt. There was no evidence of a Meckel's diverticulum.

At the age of 12 months this boy was again presented to me by his mother, within two and a half hours of a recurrence of his symptoms. Even after this short time the intussusception, which had again reached the splenic flexure, was difficult to reduce. Healed scars of the peritoneum covering the bowel showed clearly the extent of the previous invagination, and this second intussusception had the same starting-point as the first. Again there was a dimple, but no localized thickening could be felt, the whole of the bowel involved being oedematous. A year has passed since the second operation, and there has been no recurrence.

CASE III

A baby girl, 8 months old, was brought to the Hospital for Sick Children with a history of having been seized by abdominal pain seven days before. She had vomited once at the onset, but since then had taken her food well, and had not apparently had further pain. She passed one stool on the first day, but since then the bowels had not opened, except for the passage of a little dark blood on the fourth day.

On examination she did not appear to be in pain, but was pale and listless. The abdomen was distended, particularly in its upper part, where it was marked by the pattern of underlying coils of bowel. No localized tenderness was discovered, nor could a tumour be felt apart from the general

distension Rectal examination revealed that the bowel was empty, there was no tumour and no blood on the examining finger

At the operation some turbid fluid was found in the peritoneal cavity and the small bowel was greatly distended An intussusception reached half across the transverse colon It reduced easily to within an inch or two of its apex which was eight inches proximal to the ileo caecal valve The last inch was gangrenous and perforated Three inches of ileum were resected the ends closed and a side to side anastomosis of ileum to ileum just above the ileo caecal valve was performed

For the first thirty six hours after the operation 5 per cent glucose in normal saline solution was given subcutaneously every six hours the baby was kept under the influence of morphine and nothing was given by the mouth Thereafter feeding was rapidly resumed There was no vomiting and the bowels opened three times on the second day Further progress was uneventful but for a mild wound infection until the morning of the eighteenth day when the child vomited and became collapsed She remained so and appeared to have periodic abdominal pain In the evening the abdomen was opened again through the original incision There was generalized turbid exudate and in the right iliac fossa lay a coil of distended small bowel adherent to a loop of collapsed ileum, above the anastomosis On dividing the adhesion the obstruction was relieved The turbid exudate was removed and the abdomen was closed 150 c cm of 10 per cent glucose saline solution was injected into a vein Uninterrupted recovery followed and during the past year the baby has been perfectly well

It will be noticed that these three examples are ileo-colic intussusceptions This type has its point of origin in the small intestine, it is primarily enteric, but when the ileum has passed into the colon it is conveniently classified as ileo colic Out of thirty seven consecutive operations, in which I made a careful examination of the point of origin of the intussusception after reduction, it was in the ileum in thirty four, thirty three of these were ileo colic in type, and one was enteric Of the remaining three, the ileo caecal valve formed the apex in two, the third had a dimple in the caput caeci, and according to Perrin and Lindsay, should be classified as ileo caecal also These surgeons, in their monograph in the *British Journal of Surgery*, 1921, based on the surgical records of 400 cases and not upon their personal experience, give the incidence of the ileo colic type in intussusception as 31 5 per cent, in marked contrast with my small series, where it is over 89 per cent Each of the thirty four cases showed a definite thickening or dimpling in the ileum to indicate the point of origin or apex, for these two terms are synonymous I am in entire agreement with Perrin and Lindsay when they find no evidence to support Leichtenstern's theory that an intussusception may grow at the expense of its entering layer only If such were the case, there would be no thickening or dimpling to indicate the apex for this would be continually changing Thirteen of the thirty seven children were girls, the average age was 13 months, the youngest was 3 months old, and the oldest 4 years and 10 months

This high incidence of intussusception in young children starting in the ileum confirms the belief that the common cause is enlargement of a Peyer's patch, which excites uncontrolled peristalsis This is illustrated by Case I Case II suggests that such a patch may remain hypertrophied, or become so again, and then lead to a recurrence of intussusception Case III shows that resection of a gangrenous intussusception may be confined to small intestine, involving an easier and safer operation than the removal of the colon Further, it is the enteric intussusception which has become ileo colic that is most liable to be gangrenous since both the intussusceptum and its vessels have passed through the tight ileo caecal valve

I wish to thank the surgeons to the Hospital for Sick Children for allowing me to operate on these children and for permission to publish this note

MEDICAL, SURGICAL, OBSTETRICAL

EXOTOXINS IN RELATION TO VACCINE THERAPY

I think it may be fairly stated that where a germ forms, as the major part of its poisoning properties, an exotoxin, —that is, a powerful diffusible poison secreted into the liquid culture medium in which it grows—a serum is usually the most successful antidote Examples of this are tetanus, diphtheria, botulism and dysentery On the contrary, when the endotoxic factor is almost wholly predominant—that is when the toxin is contained firmly within the germ and only liberated after autolysis—a vaccine is indicated as the appropriate antidote

The clinical pathologist probably makes more vaccines from the staphylococcus and streptococcus than from any other germs and in respect of these two organisms I would like briefly to point out that diffusible exotoxins are secreted by both as well as endotoxins as also in dysentery of the bacillary type albeit in the last the exotoxic factor is by far the more important, and so important, in fact that serum therapy is chiefly useful, rather than vaccines *Staphylococcus aureus* and some strains of *Staphylococcus albus* form haemolysins and leucocidins, the former being quite powerful as cultures on blood media show The zone of haemolysis around the colonies of *Staphylococcus aureus* is markedly conspicuous The streptococcus also forms exotoxins—streptolysin, which is a very powerful diffusible toxin whose effects we are aware of in fulminating cases and also a haemolysin well shown in the haemolytic strains

Kolmer[1] has shown that the body not only contains antitoxins to these poisons but that it can be stimulated to form more if so desired by appropriate and graduated inoculation

The average autogenous vaccine ignores the important toxins The staphylococcal emulsion is washed off the agar slope and suspended without the least regard for the exotoxin That is the usual procedure As a matter of fact, with the immunogen of Ferry and Fisher,[2] actually the reverse process is utilized and the washings are utilized alone, and the very important endotoxic factor is ignored I maintain that either process is irrational, and I have endeavoured to combine the two factors in vaccine therapy as applied to the above two organisms as follows The ordinary saline emulsions ignore the potent haemolysin and less potent leucocidin and therefore it is more rational to make one's vaccine from liquid media and to include a certain proportion of that liquid medium in the vaccine

The technique is quite simple Twenty four to forty eight hour glucose serum broth emulsions are prepared and centrifuged The emulsion of germs is made up in saline, and 5 per cent of the supernatant fluid containing the endotoxins is added to the vaccine I am sure that the results by this technique are superior to those formerly obtained and that this method constitutes a more rational way of making vaccines from the organisms in question

Reviews

DANGEROUS DRUGS

The Yale University Press has published a book[1] of some 120 pages entitled *Dangerous Drugs: The World Fight against Illicit Traffic in Narcotics*. The author, Mr Arthur Woods, was formerly Police Commissioner in New York City, and he has written with the advantage of a close observation of the League of Nations' Advisory Committee on Opium and other Dangerous Drugs. Much of the material for the book was collected in the course of the opium inquiry in the Philippine Islands, which was undertaken by a commission of which Mr Woods was a member. The book, however, is not confined to the Philippines, but deals with the whole problem of the illicit traffic in narcotics and the efforts which have been made to control it. Mr Woods has also had the opportunity of observing the working of the Permanent Central Opium Board, which is the executive body set up by the Geneva Convention of 1925 to control the international trade in narcotics. [illegible] Mr Woods has been able to obtain information from official sources which is not generally available. The number of addicts in the United States has been variously estimated at from 100,000 to over 1,000,000. The author points out that there can be no doubt that narcotic addiction, as it exists in the present day, is a comparatively modern evil, and that "it is the product of a civilization which has developed a vast and complex machinery of production and distribution, and of a social organization which has developed certain types of character." He traces the efforts at international control of the traffic in narcotics from the Shanghai Commission of 1909 to the action by the League of Nations under the Geneva Convention of 1925. Although most of the nations have bound themselves, in accordance with Article 9 of the Hague Opium Convention, to limit the manufacture, sale, and use of medical opium, morphine, heroin, cocaine, and their preparations to exclusively medical or legitimate purposes, and to co-operate internationally to prevent their use for any other purpose, yet illicit production and distribution of these drugs is admittedly "enormous" and "appalling." The huge financial interests involved in the contraband traffic, and the ingenious methods of the international gang of smugglers who thrive on the gigantic profits derived from this illicit commerce, are abundantly demonstrated.

Mr Woods's final chapter on "What is to be done?" has little that is new to suggest in order to remedy the evil he has exposed. He says "the need for drastic action is clear," but such action amounts to little else than the vigorous and universal enforcement of the provisions of Article 9 of the Hague Opium Convention of 1912, referred to above. He holds that it is also essential that the acreage devoted to the culture of the poppy and coca leaf should be reduced. The default of even one producing country may "put the world at its mercy," and so long as Turkey, Persia, and China are unable, or unwilling, to ratify and effectuate the opium conventions, the leak of illicit production has not been stopped. Even some European countries have notoriously failed to fulfil their contractual obligations, and have been the source from which huge illicit consignments of narcotics have emanated. Mr. Woods is sanguine enough to hope that a more educated public opinion in regard to the social peril involved will so influence Governments as to ensure effectively both the internal and international control of the trade in drugs of addiction.

MEDICAL STATISTICS

Statistics can be made a dangerous instrument if carelessly used, as the Editor has pointed out elsewhere, and it is more and more in the care of the medical health posts into the hands of one kind or another it be [illegible] safeguards imposed to guard against the pitfalls which may accompany their use. We therefore welcome *An Introduction to Medical Statistics* by Hilda M. Woods and W. T. Russell, which sets out in a concise and intelligible form the elementary principles and methods with which every expert in public health should be familiar.

Here are [illegible] which custom more than can be readily defended by the average medical man or woman who does not specialize in the study of the elements of vital statistics. From a perusal of one of these larger books the student will probably emerge with a rather confused idea of masses of figures relating to a great many classes, but without any very clear notion that the study of vital statistics contains anything which can be of real benefit to the clinical staff of a public health department. A glance over their work may lead him to the opposite view, that this is clearly a business for experts with some flair for mathematics and a prolonged training in statistical methodology. In this latter view he will be mistaken if he is thinking of statistical research into medical problems, but as regards the preparation of his annual report which he becomes a medical officer to some public body or institution either point of view is unfortunate. These reports will perforce be full of statistical tables and summaries, and from them he will at least be expected to draw some clear-cut conclusions which may influence future policy in the control or treatment of disease.

Hence a course of training in State medicine should include as clear a presentment as it is possible to give, in the short time which can be devoted to this subject, of the principles involved, not only in the collection and analysis of statistical data, but in the drawing of legitimate conclusions from them. Having such a purpose in view, this small book undoubtedly fills a gap which has long been felt. That it does so adequately is guaranteed by the fact that the joint authors are colleagues of Professor Major Greenwood, who writes the preface. A study of the book justifies the confidence that such a recommendation inspires. It contains eleven chapters, of which six deal with the collection, representation, and standardization of vital statistics and construction of life tables, another four deal with frequency distributions, variability, correlation, and regression, and the last with the application of the theory of sampling to estimating the reliability of rates and averages. Such an attempt at condensation and simplification must necessarily carry with it certain dangers, in that the student may be left unaware of the limitations of some of the methods described. One feels, for example, that in the chapter on correlation a warning that the correlation coefficient can only be usefully employed when the regression is approximately linear might perhaps have been added.

The authors are to be congratulated on carrying out a difficult task in an admirable way.

PHYSIOLOGY OF MUSCULAR EXERCISE

The study of *The Physiology of Muscular Exercise*[1] is one of the most interesting applications of physiology to human affairs that have engaged the attention of investigators during the present century It illustrates in the clearest manner the wonderful reserve powers of the body and the way in which various and complicated co ordinating processes succeed in keeping the physico chemical state of the blood and tissues almost unchanged in spite of the many disturbing tendencies which are brought into play during severe exertion The present (third) edition of BAINBRIDGE'S book on the subject has been rewritten by two young American physiologists, and very ably rewritten too The defeat of the Oxford and Cambridge (England) athletes by the clearly superior team from Harvard and Yale on July 18th is not without its significance for us The Americans beat us at sport because they study the subject and organize their training on scientific lines An event is won, "in the long run," as much by cerebral as by muscular effort

The treatment of the subject, as with the original edition, centres round the means by which the tendency to alteration in the properties of the blood during exercise are counteracted, partly by the peculiar properties of the blood itself, partly by alterations of a compensatory nature in the action of the circulatory and respiratory systems It is evident that the physico chemical properties of the blood are of fundamental significance to the whole question, hence the importance of the discussion of these properties from the standpoint of the remarkable investigations which have been so ably conducted at Harvard by L J Henderson, and in which the present authors have participated It is not too much to say that these studies not only form the most conspicuous feature of the changes in this volume, but that they represent one of the most brilliant scientific contributions of the present century It is abundantly clear that our friends across the Atlantic know how to organize teams, whether for work or for play, and if we claim that they are rather apt to work at their play, we must also admit that they work at their work In the language which they are alleged to use, we "hand it to them" The question of exercise at high altitudes including that of acclimatization to those altitudes is also dealt with, and is another illustration from which we see that the centre of gravity has apparently left the Oxford and Cambridge controversy—so long an entertainment for the cultured—and crossed to America

The book has undergone thorough and competent revision, on which the authors deserve warm congratulations The bibliography is considerably extended, particularly as regards recent American work, and the book as a whole is a well balanced presentation of the prevailing opinions on this closely interwoven fabric of exact data No better book could be read by anyone who wishes to know how physiological methods can be applied, or whether physiology has any real value in human affairs

POST TRAUMATIC CAUSALGIAS

In his Lyon thesis Dr PAUL BLANCHET gives an account of the post traumatic causalgias described by Weir Mitchell,[2] and their prognosis, by abstracting thirty five cases previously recorded, by describing in considerable detail a case dating from a gunshot wound in 1914, and by a critical analysis In a bibliography of 200 items, twelve bear a date before the European war, no fewer than 145 appeared during the war, and the remainder (of various dates) bear less directly on the subject Causalgia is ascribed by the author to hypersensitiveness of the sympathetic, and he quotes the dictum of his teacher, Professor Froment, that it is "the cry of the sympathetic Causalgia, or burning pain in the cutaneous area supplied by an irritated nerve and showing the well known glossy skin, is divided into two forms—the hyperaemic and the ischaemic These are characterized respectively by redness and heat, and by pallor and a depressed temperature, and are due to stimulation and to degeneration of the vaso dilator nerves The form with hyperaemia as its predominant manifestation is the more frequent, and fortunately the more susceptible of cure, most of the patients recovering spontaneously in the course of some months, whereas the rarer ischaemic form is much more obstinate and runs a course of years The *psychological manifestations are secondary, not primary* The surgical measures for the relief of causalgia are numerous, amputation should be avoided when possible as it often aggravates the pain and extends its area; peri arterial sympathectomy is the most successful procedure, but ramicotomy, provided that all the branches supplying the painful area are divided, has given good results This is an example of a thesis useful to the compiler

CLINICAL RECORDS BY MEANS OF *X* RAYS

The book on this subject,[3] by Privatdozent VICTOR HOFFMANN of Cologne, with its English and German texts, is useful and unique In the preface its object is stated to be "to demonstrate the most important bone and joint diseases and their subsequent course *X* ray photographs have been used because by them it is possible to show the various stages and general course of this disease group, and because after histological representation, they leave the most profound impression" This is quite true when as in this case, the radiographs are of first rate quality and well reproduced The author says that the pictures are intended to take precedence over the text, and he properly insists on the lesson they teach of the healing power of nature Such a series as that of four pictures showing the course, ending in regrowth of a vertebra, and cure of a case of osteomyelitis of the spine on pages 14 and 15 is of extraordinary interest, and most attractive Indeed, we may say as much for all the cases which have been selected after many years' hard work We cordially endorse the author's wish that the publication of the book in English and German may "be beneficial to mutual scientific work between the different nations" It includes 156 series of radiographs, each consists of a number of radiographs, the total number being nearly six hundred.

A SURGEON'S MUSINGS

The tenth edition of Dr JOHN CHALMERS DACOSTA'S *Modern Surgery* has recently appeared but in the meanwhile he has written widely, often with a reminiscent flavour and always with an interesting touch as is shown in the twenty one *Selections from the Papers and Speeches*[4] As Samuel D Gross Professor of Surgery at the Jefferson College, Philadelphia, he writes with admiring affection of his predecessors in that chair the elder Gross "the emperor of American surgery

---

latter's son, S. W. Gross, who "said what he meant, and meant what he said"; and Professor W. W. Keen, the veteran surgeon of North America's two great wars, who is happily still with us. In his account of the foundation and the founder (George McClellan) in 1825, in the "last surgical clinic in the old amphitheatre" in 1922, and in the history of the old wooden operating table, of Jefferson Medical College Hospital, he has constituted himself its historian. Like Professor Harvey Cushing, to whom this collection of essays is gracefully dedicated, the author has travelled far in biographical studies—for example, in "Medical Paris during the reign of Louis Philippe," his sketch of Baron Larrey, and "The personal side of Pepys." In "Then and Now," his oration at the jubilee of the Philadelphia County Medical Society in 1899, the history of the city of brotherly love when appendicitis was practically unknown, is another footnote to medical history. Admittedly "subject to the luxury of musing," Dr. DaCosta writes "behind the office doors" about medical authors, and the doctors in Dickens's novels.

NOTES ON BOOKS

The fact that Colonel L. W. HARRISON has found it necessary to bring out a fourth edition of his *Diagnosis and Treatment of Venereal Diseases in General Practice*[7] indicates that this book has established a reputation in medical literature. Room has been found for a considerable amount of new matter by excising information which appears in standard textbooks on medicine and surgery, and is superfluous in a work devoted to venereal disease. The chapter which bears the chief marks of alteration and re-editing is that devoted to the treatment of syphilis. The author has always felt strongly that, in spite of repeated warnings, under-treatment of syphilis is still a common fault, and he again brings out the importance of prolonged and intensive treatment, even in cases where the disease is diagnosed at an early stage. An analysis of his results at St. Thomas's Hospital has led him to the conclusion that the programme of treatment which he laid down in his first edition is barely adequate, although at the time of publication it was thought by many to be longer and more intensive than necessary. Consequently, in the present edition he has still further extended the courses required for the treatment of primary disease. Additional matter now appearing for the first time is a description of that somewhat rare and puzzling condition, granuloma venereum, and climatic bubo. The practitioner will undoubtedly find in this book everything he requires in the way of guidance in the diagnosis and treatment of venereal troubles. He can also rely on it to furnish him with precise information about the correct procedure in practically all the circumstances which he is likely to encounter.

In reviewing the American translation of Dr. CEMACH'S book on Surgical Diagnosis[8] in the early part of 1929 we endorsed the translator's dictum that the author had furnished an exceptional amount of information in an easily accessible form. The fifth, improved, and enlarged edition of the original German work deserves similar approbation. In some respects it is better than the American translation, for it is less cumbrous, yet it contains more plates and tables, and, notwithstanding the drawbacks to this form of handbook, which we pointed out two years ago, it gives at a glance useful information on surgical diseases of wonderful amount in small compass. Some of the illustrations are adequately coloured in order to illustrate such lesions as erysipelas, lymphangitis, and others. This edition is a useful picture-book of surgical diseases and injuries, but its value would be much enhanced by the provision of a far more copious index. With its 589 illustrations it is not dear at 18 marks, unbound.

Professor CURTIS M. HILLIARD'S attractively written book on *The Prevention of Disease in the Community*[9] resembles those in the Boston Health Lecture Series in being intended for non-professional readers, and especially to provide college students with the rudiments of preventive medicine and hygiene in addition to the elements of personal hygiene, which are more generally taught in American schools and colleges. The instruction is conveyed with suitable examples: thus, "the typhoid mother-in-law" was a kindly woman who visited her six married daughters, and with the best intentions assisted in their kitchens, thus infecting at least thirteen persons, though, curiously enough, her own daughters and sons escaped any recognized infection.

The continued popularity of the injection treatment of varicose veins is shown by the appearance of another handbook on this subject, entitled *The Rational Treatment of Varicose Veins and Varicocele*.[10] The author, Mr. W. TURNER WARWICK, has endeavoured to supply answers to the many questions of detail as regards the actual procedure and its sequels, and the various kinds of emergencies which may occur. The subject-matter is more thoughtfully conceived than in some similar publications, and the bibliographical references throughout are numerous. Mr. Warwick gives reasons for the various practical suggestions that are made, and his little book can be recommended to the attention of our readers.

A new edition has been published of the Register[11] of members of the Chartered Society of Massage and Medical Gymnastics, corrected up to April, 1931. A valuable feature of this reference book is the fact that it contains an index of those practising massage classified under postal districts, as well as information about the qualifications in each case.

PREPARATIONS AND APPLIANCES

VITAMIN CONCENTRATE OF COD-LIVER OIL

McKesson's vitamin concentrate of cod-liver oil is a fluid preparation which contains both vitamins A and D in eleven times the concentration at which they occur in a potent sample of cod-liver oil. This preparation has been accepted by the Council of Pharmacy and Chemistry of the American Medical Association (*Journ. Amer. Med. Assoc.*, 1930, xcv, 1347). The makers state that their preparation has been subjected to careful tests as regards stability. The preparation is free from the well-known odour and taste of cod-liver oil, and the dose recommended is three to six drops three times a day.

LACARNOL

Lacarnol is an extract of certain mammalian organs. It has a selective dilator action on the coronary arteries, but does not influence the general blood pressure. The preparation contains nucleosides, and the evidence available suggests that the active principle is adenosin. This preparation has been subjected to numerous laboratory and clinical tests in Germany. Fahrenkamp (*Munch. med. Woch.*, 1930, No. 44, p. 1914) has reported favourably on its action in angina pectoris. He states that the preparation produces benefit even after oral administration. (Supplied by Bayer Products Ltd.)

"TABLOID" CAROTENE

"Tabloid" carotene is a new preparation put forth by Messrs. Burroughs Wellcome and Co. Carotene is a pigment found in various vegetable and animal foods, and is an unsaturated hydrocarbon with an empirical formula $C_{40}H_{56}$. It is believed to be converted in the animal body into vitamin A which is colourless. Each tabloid of this preparation contains 0.002 gram of carotene, and two tabloids are approximately equivalent to the vitamin A content of one teaspoonful of an average cod-liver oil.

WAR AS AN EDUCATOR IN HYGIENE

War is perhaps the severest test of hygiene and preventive medicine Many theories and prejudices apparently unassailable in normal times are shaken or upset by war conditions, most of all in an invaded country, where the destruction of towns and villages, and the flight of the civilian inhabitants to other parts of the country, add to the health problems created by martial law, mobilization, and the transport of troops How France reacted to this position in 1914 and afterwards is described by Professor Léon Bernard in one of the monographs of the Carnegie Endowment, lately published, entitled *La Défense de la Santé Publique pendant la Guerre* [1] These monographs contain a history of the war in the different countries concerned, and, as pointed out by Mr J T Shotwell, professor of history in the University of Columbia, they are intended to give "something between a personal description and an official report" Professor Bernard, while explaining how the sanitary conditions of France were affected by the war, and the steps which were taken to preserve the public health, claims that on the whole the new and urgent questions brought into existence at that time were met with intelligence and vision, the more remarkable because many of the problems which had to be faced were new and demanded methods not previously understood or willingly accepted

Before the war the French were inclined to trust normal civilization and the climatic advantages of their country to preserve the public health, but with the war upon them they had speedily to learn the necessity of adding every scientific weapon available for the purposes of hygiene As soon as hostilities began, the civil authorities had to realize the necessity of arranging systematically for the treatment of their civilian sick and of dealing with infectious diseases—hence better civilian notification and prophylaxis, the interchange of information between civil and military authorities, as well as the isolation of the patient and the disinfection of his belongings In addition, new ideas arose for preventing disease in districts where troops were billeted, prisoners of war were interned, or refugees arrived from the invaded areas Water purification, the maintenance of pure food supplies, the institution of campaigns against flies and rats, and the cleansing of areas occupied by troops, had also to be undertaken They were not, in one sense, new measures, but their application was enormously extended and consolidated

Professor Bernard's story brings out some points of interest peculiar to a country in which military service is compulsory It is wiser to call young soldiers to the colours in the summer time rather than in winter, "children's diseases," such as scarlet fever, measles, mumps, diphtheria, occurred more frequently among the 1917 class, recruited in January and training until August, 1916, than among the 1918 class, whose period of training was from April to November, 1917 In the case of measles, France, in consequence of compulsory service, was more fortunate than England or the United States, as, owing to the normal requirements of conscription, the mass of the male population had already served in the army, and most susceptibles who had not suffered from measles in childhood had probably caught it during their pre-war military service Even so, however, measles was fairly prevalent in the French army during the war, among the troops of the interior which included those in barracks, training camps and depots, and the case mortality was twice as high among these men as in the pre war army

In France special dangers arose from the introduction of epidemics by entrants from neutral countries, by persons repatriated from German internment camps, and by refugees from the evacuated areas All of these had to be examined for infectious diseases, and, when necessary, isolated, cleansed, and perhaps vaccinated Use was made of preventive inoculation to a far greater extent than in any previous war As the war went on, vaccination against small pox, inoculation against typhoid, cholera, and plague, and immunization of diphtheria contacts were increasingly used, not only in the army, but also, when necessary, among civilians

The account given of the control of the enteric group of diseases in France is particularly interesting Deaths from these diseases had been growing less for some years before 1914, and it might have been expected that the upheaval of war in an invaded country would have arrested the fall Except, however, for a rise in 1914–15, chiefly among the front-line troops, the fall has continued both during and after the war Professor Bernard claims, with some reason, that this has been due to the energetic prosecution of water sterilization, and especially to anti-typhoid inoculation That the diminution of the prevalence of typhoid during the later war years was to a great extent due to inoculation is suggested by the consideration that originally in 1914, *B typhosus* was the cause of the majority of infections in the army Inoculation by anti-typhoid vaccine, on a large scale, reduced these, but infections due to *paratyphosus* B increased during 1915 Following the experience gained among the North African troops, the mixed T A B vaccine was introduced in France in the autumn of that year with the happiest results as regards all enteric infections One effect of the contrast between the morbidity from typhoid diseases among the civil population and that among the inoculated troops was that the former in districts where typhoid broke out themselves pressed for inoculation All enteric infections, it is stated, had

[1] *La Défense de la Santé Publique pendant la Guerre* Par le Dr Léon Bernard Paris Les Presses Universitaires de France, New Haven, U S A Yale University Press, London Milford, Oxford University Press 1931 (25 6d net)

almost completely disappeared from the army in 1917 and 1918.

To English readers, the comparative ease with which preventive measures against small-pox can be undertaken in a country where anti-vaccination societies do not flourish is refreshing. The readiness with which vaccination against small-pox is accepted in France is well known, and sometimes envied, by our own public health authorities. At the commencement of this war, therefore, the populace, especially in Paris, where the epidemic which followed the Franco-Prussian war was remembered, sought and obtained vaccination on a large scale. Although, normally, vaccination is performed in France at the ages of 1, 11, and 21 years, a surprisingly large proportion of vaccinations were found to give successful results in 1914 and 1915—a result which led to the legislation of September 7th, 1915, for the compulsory vaccination during war, public calamity, and at times of epidemic or threat of epidemic, of all persons, irrespective of age, who could not prove that they had been successfully vaccinated during the previous five years. As a result, 1,005,468 vaccinations were performed during 1914, 1915, and 1916. In 1917 there occurred eighteen cases of small-pox, with four deaths, in Lyons. General vaccination of the population was immediately decreed, thirty-three centres of free vaccination were set up at different points, and in addition all the school children of both public and private schools were vaccinated; the outbreak was stopped. This may have been using a steam-hammer to kill a fly, but at any rate the fly was effectively killed. During the whole period of hostilities there were 561 deaths from small-pox in France. These included imported cases, and form a striking contrast to the 60,000 deaths which were caused by small-pox in 1870–71.

It is interesting to note, in a volume of this kind, the attention which had to be given to the epidemic diseases of childhood—such as chicken-pox and whooping-cough. Mumps was second only to the great influenza epidemic of 1918 in the number of cases it caused among young soldiers in the French army, though influenza was, of course, incomparably more deadly. As in England, cerebro-spinal fever was, until the influenza arrived, the most formidable epidemic disease with which the French medical authorities had to contend in their standing camps. In Paris and its suburbs there were more than twice the number of notifications in 1915–18 than in the years 1911–14, the greatest number occurring in 1915. In the army it was the recruits under instruction who suffered most, the disease never gaining a firm foothold in the trenches. Variations in the predominating type of meningococcus were found in different years. The suggestion that the most deadly of these were importations from the British army can hardly be substantiated; the type of organism predominating in outbreaks of cerebro-spinal fever varies in epidemic and inter-epidemic times, and may even do so in different periods of the same epidemic. The activity for health which the war made so imperative in France, as in other countries, produced movements for dealing with venereal disease and alcoholism and for the care of mothers and children which have been actively continued since.

The campaign against tuberculosis was perhaps the most remarkable of the French war-time efforts. Before 1914 there existed only a small number of sanatoriums, dispensaries, etc., unconnected and of very unequal value, while the general public was largely ignorant of or indifferent to the disease. Faced with the fact, however, that tuberculous soldiers were apt to spread the disease if discharged direct to their homes, the Government instituted various schemes under which tuberculosis patients could be treated and trained in the hygienic routine necessary to enable them to live at home without risk to others. These schemes included: (1) sanitary hospitals where the patients were sorted out into very slight cases likely, under suitable treatment, to become fit for light work in depots or on the reserve, hopeless cases which were cared for here until their death, and severe but curable cases which were transferred to the sanitary stations; (2) sanitary stations where patients remained for about three months for educational treatment; (3) local committees whose chief task was the care of the patient and his family at home, though, when necessary, they would arrange for treatment in sanatoriums and hospitals; (4) a central committee which was responsible for collecting money for the local committees, issuing literature, and generally exercising a central control over the anti-tuberculosis crusade. Since the war this organization for combating tuberculosis has been adapted to peace requirements.

Professor Bernard's interesting volume, in short, is eloquent testimony of the numerous measures for the preservation of the public health which were introduced in France during this critical time. They may not always have produced all the results expected from them, but they were at least successful in preventing the calamities from disease and destitution formerly believed to be inseparable from war. And evidently their effects did not end with the period of hostilities. The public conscience of the country was stirred to a sense of its duty in these matters, and an interest in hygiene was created which will bear fruit in the future and will serve as an important item on the credit side to set against the burden of misery, ruin, and debt left by the years 1914 to 1918.

THE ROLE OF FATS IN THE STOMACH

Fats form a regular constituent in the foods of most races, and the relatively high caloric value of fats makes them a particularly useful addition to the diet in temperate and cold countries. It is nevertheless a common experience that fatty foods are "heavy" (that is, difficult of digestion), and in the case of weak stomachs they are eschewed. The mechanism of the action of fats on digestion in the stomach was elucidated in the experiments of Pavlov, who showed that fat did not excite a secretion of gastric juice when introduced into a dog's stomach, and, further, that fat given with

meat inhibited the secretion normally evoked by meat. This inhibition was brought about, not by the fat coating the mucous membrane of the stomach and so preventing the flow of gastric juice, but reflexly from the duodenum. The motility of the stomach is reduced by fats, and this, too, has been shown to be reflex, the presence of fat in the duodenum producing a contraction of the pylorus. This reflex effect of fats is initiated in other parts of the intestine. Ewald and Boas had shown in 1886 that the addition of olive oil to an enema mixture considerably reduced gastric secretion. Their discovery was not used, however, till later, when other workers found that fat was a means of reducing gastric acidity.

The frequency of gastric hyperacidity as a cause of symptoms of indigestion, and the common association of hyperacidity with gastric and duodenal ulcer has led to a system of dieting whose aim is to neutralize or reduce the acidity. For the latter purpose fats are a leading constituent of most of the standard ulcer diets; milk, pure cream, unsalted butter, or various oils, especially olive oil, enter largely into the diets advocated. The form in which fats are taken is probably of importance. A recent research by Morrell Roberts,[1] on the effect of oils on gastric secretion and motility has shown that inhibition follows the addition of oils to the sample test meal or the administration of oil before the test meal. A series of oils was tested; of the glyceryl esters of the higher fatty acids other than oleic acid, several were found to be relatively more efficient in inhibiting gastric secretion than olive oil, which is usually given in the treatment of gastric ulcer. Linseed oil, cod-liver oil, and cotton-seed oil all showed more inhibitory power that olive oil. Roberts found, thus, that the more efficient oils were composed of the less saturated fatty acids. The higher fatty acids themselves were also inhibitory, while the alkali salts of the higher fatty acids (that is, the soaps) actually stimulated gastric secretion. Glycerol and liquid paraffin appeared to be entirely without action on secretion or motility. Linseed and olive oil were found, further, to inhibit the action of recognized evokers of gastric secretion, such as sodium bicarbonate, caffeine, and meat extracts; the only exception being histamine, which was unaffected by giving oil. Histamine appears to have a central action, and differs from the other stimuli to gastric secretion, which have a local action on the stomach.

Clinical observation of the results of treatment of gastric and duodenal ulcer, and of the state of the gastric secretion after cure of the ulcer, has shown that a lasting inhibition of acidity is not necessary. Ulcer cases often show a higher acidity after treatment and healing of the ulcer than before treatment is begun. Some factor other than the acidity, therefore, must be sought when considering the causes of gastric and duodenal ulcer. A new theory of their causation has been put forward in a recent book.[2] Many English and Continental observers have postulated a condition of gastritis antecedent to ulcer; this pre-ulcerative gastritis is usually most definite in the pyloric antrum. Dr. Spira believes that a pre-pyloric gastritis is set up by the combined retention of acid and regurgitation of bile into the stomach that follows the ingestion of an excessively rich and fatty diet. He points out that experimentally the combination of hydrochloric acid and bile salts is able to produce ulcers of the mucous membrane in animals. He would therefore advise limiting the intake of fats as a prophylactic measure against the pre-pyloric gastritis which is regarded as a forerunner of ulcer. The weakness of Dr. Spira's theory is that regurgitation of bile and pancreatic juice is not abnormal; it is the usual means of neutralizing the gastric secretion. Without further evidence in support of this theory, physicians will probably continue to treat conditions of excessive secretion of gastric juice in the customary way with fatty foods and oils.

FINANCIAL COMMITMENTS OF THE MINISTRY OF HEALTH

Special interest attaches at the present moment to the recently issued twelfth annual report of the Ministry of Health,[1] which covers the twelve months ending March 31st, 1931, and indicates the extent of financial liability involved by the activities of this Department of the Government. Mr. Neville Chamberlain, who signs it, recalls that the report was prepared before the present National Government assumed office, and that it relates to a period for which the previous Government was responsible. The annual report of the Chief Medical Officer is being published separately, as usual. The services administered by the Department involved expenditure classified under five heads—namely, the Ministry of Health Vote of £19,224,200 net; grants to local authorities concerned with employment schemes in necessitous areas in England and Wales, amounting to £440,000; Exchequer contributions to local revenues, which totalled £39,560,000 net; National Health Insurance Funds, which entailed a sum of £32,220,000; and £30,800,000 in respect of the Pensions Account. The gross total of the Ministry of Health Vote was £20,484,200, including housing grants (£11,855,000), grants in aid of insurance funds (£6,050,000), central administration (£2,235,250), and miscellaneous grants (£343,950). An amount of £1,260,000 was recovered by the Department from various sources, and further expenditure was incurred, so that the estimated net cost to the taxpayer of the services for which provision was made in the Ministry of Health Vote is assessed as £19,836,326. As regards the Exchequer contribution to local revenues a total grant of £44,100,000 was provided, £43,828,056 being actually disbursed in the year, but of this grant £4,540,000 represented an allocation from the Road Fund. An interesting table indicates the way in which loans to local authorities in England and Wales for public works (excluding housing purposes and temporary provisions for current expenses) have risen from £35,068,344 in 1929–30 to £47,365,434 in 1930–31. In this connexion it is noteworthy that public health requirements rose from £10,162,383 to

[1] H.M. Stationery Office. (5s. net; postage 4d.)

£14,378,952; education loans from £7,150,327 to £9,362,513; and roads, bridges, and street improvements from £8,761,145 to £11,642,179. The heaviest increases were those in loans to county councils, county borough councils, and urban and rural district councils; there was a definite decrease in those to metropolitan borough councils. In England in 1930 the cost of medical benefit was over £8,862,000; of this sum medical practitioners received over £6,447,000, and £1,927,500 of the balance was expended on drugs and appliances. About £200,000 was paid to rural practitioners on account of mileage, nearly £10,000 was set aside for providing post-graduate courses for them, and about £196,000 was paid to medical practitioners for drugs and appliances supplied by them. There was a decrease of over 6.5 per cent. in the number of insurance prescriptions dispensed in 1930 as compared with 1929; the total of the chemists' accounts fell from £1,922,800 to £1,739,708, and the average total cost of drugs and prescribed appliances per insured person from 3s. 1¼d. to 2s. 8¾d. Excessive prescribing, it is added, has been reduced to very small proportions. In spite of the continued production of houses on a large scale, the average building price of non-parlour houses has only fallen from £362 in the calendar year 1928 to £344 in the twelve months covered by the report, and to this building cost has to be added the expense of land, roads, sewers, and fees, an addition which may, in towns, range normally from £45 to £95, and in rural areas from £10 to £40 for each house. A special review of the position is therefore in progress by an inter-departmental committee, and mention is made in the report of directions in which economies are possible. The gross expenditure by local authorities on tuberculosis schemes during 1929–30 was £3,382,553, which is an increase by £112,919 on the figure for the previous year. Loans amounting to £130,697 were sanctioned by the Minister during the year for the provision of open-air swimming baths; it is pointed out that such baths can be constructed much more cheaply than can closed baths, are larger in area, and are more effective for the promotion of physical health.

THE DEUTSCHES HYGIENE-MUSEUM, DRESDEN

There are two museums in Germany which every member of the medical profession should endeavour to see—the Deutsches Museum at Munich and the Deutsches Hygiene-Museum at Dresden. The former is concerned with science and industry; the latter with popular education in all matters appertaining to health. The Munich museum is a stupendous achievement, which sets a standard for all time in museum technique and organization. Both museums have departed from the fixed exhibit. As far as possible the "Do not touch" fetish has been abolished. The Deutsches Hygiene-Museum, with which this note is chiefly concerned, has been described in some detail in a recent number of the *Museums Journal* (xxxi, No. 4, 140). It is pointed out that the organization is a national one—a "registered association" to which belong representatives of the national Government, various States, municipalities, insurance companies, and other organizations. The administrative director is Government-Councillor Georg Seiring, M.D., and the scientific director Dr. Martin Vogel. In 1930 the new building was completed, and it may be said to be a home worthy of a collection that is, in many ways, unique. Practically every object in the exhibition has been manufactured on the premises to serve a definite purpose: it is a collection built round an educational scheme. Moreover, it is deliberately constructed for the benefit of other similar undertakings, in that practically all of the objects shown can be reproduced for exhibition elsewhere. In the workshops of the museum over a hundred skilled craftsmen are employed. The building is designed on a lavish scale, with spacious corridors, exhibition halls, workshops, laboratories, store-rooms, packing rooms, offices, a vast reception hall, and two lecture theatres. Special and adequate arrangements have been made for heating in winter and cooling in summer. The lighting is excellent, all galleries being flooded evenly with diffused light. Great attention has been devoted to the decoration, which is simple but varied, each hall having its own distinctive colour. The arrangement of exhibits enables the visitor to study the whole collection in logical sequence; he can make a complete tour of the museum without retracing his steps or losing the thread of continuous instruction. The aim of the Deutsches Hygiene-Museum is to teach the public to think and act hygienically. The exhibits are well conceived to achieve this object, for they attract and interest at the same time. Every device of movement and illumination has been utilized to fix the attention. The transparent man, with intermittent lighting of the various organs, teaches a striking lesson in elementary anatomy. Working models demonstrate the circulation, the action of the valves of the heart, the passage of nervous impulses, reflex action, the mechanics of muscular power, joint movement, voice production, etc. Here in the central hall, as a groundwork to all hygiene, we have the study of *man*, aptly introduced by models of cells, tissues, plants, and animals, with the various factors which determine healthy life and stimulate growth. In the galleries the story of life is elaborated so as to embrace the various contacts and activities which influence the health of the people. Here are sections dealing with the woman as wife and mother, with heredity and eugenics, popular education, nutrition, housing, and physical culture. Here, too, are shown historical exhibits and demonstrations of cancer, tuberculosis, industrial and sexual diseases. It is too much to expect perfection, or even complete uniformity, at this early date. Many of the illustrations are crude; certain of the sections, especially in the upper gallery, are not up to the standard which the museum has set for itself, but where there is so much that is admirable it would be ungracious to lay stress upon such defects, which time will remedy. The external work of the museum is of international importance. In this department an effort has been made to supply the material so urgently needed throughout the world for health education. The benefit of a central institution for such an object is obvious, for in this way apparatus, models, and pictures, devised and constructed under carefully controlled conditions, can be reproduced cheaply and effectively for universal distribution. Probably, however, it would be better for each country to have its own institution, so that the material could be made to conform to national susceptibilities and

requirements. The International Health Service of the Dresden Museum supplies anatomical and biological pictures, films, lantern slides, posters, charts, and casts. The casts, which reproduce various skin lesions, are made of a durable material which can withstand tropical heat. Possibly the representations of the conditions are not so perfect as in the old wax models, but for popular teaching they are adequate, and the price is very reasonable. A word of caution must be given with regard to the posters. In some of them the English translation of the German text is very bad, so that it is always advisable, before ordering, to see the exact English wording. It will be clear, from this summary of the work of the Deutsches Hygiene-Museum, that the project is an ambitious one ; it is a pioneer effort of vast magnitude, and one which merits the support of all who are interested in health as an international responsibility.

ADMINISTRATION OF TEACHING HOSPITALS

The organization of hospitals becomes more and more complicated as the treatment of the sick becomes more efficient and specialization more necessary. This process of evolution is taking place along as many different lines as there are hospitals, and it is a subject of interest and importance to all who work in hospitals, and to all who apply to hospitals for aid. In the teaching hospitals the problems to be solved are more numerous and more intricate than in the non-teaching hospitals, for the interests of medical education must there be considered, as well as those that concern the care of the sick. For those who direct or influence the changes that must be continually taking place in the organization of a teaching hospital it is helpful to hear of the difficulties that are encountered in other institutions, and of the experiments that are being made to solve them. In a small book entitled *Medical Administration of Teaching Hospitals*,[1] Dr. Emmet B. Bay has reported the results of a study of the organizations, from the medical as contrasted with the business points of view, of nineteen teaching hospitals in the United States of America. Numerous problems are studied, such as the duties of the dean of the medical school in relation to the superintendent of the hospital, the allocation of beds to the different specialties, the administrative duties of the medical staff, the carrying out of laboratory tests, and the keeping of the case-records. The results of the study are analysed briefly, details dependent on local conditions are avoided, and the conclusions are expressed in general terms, and are suggestions rather than deductions. Many of the problems studied are naturally of more interest to those concerned with teaching hospitals in the United States of America than to those concerned with similar problems in this country, but the book has an international interest because it indicates the points that are worthy of attention and which should be considered in all teaching hospitals, if unnecessary friction is to be avoided, economies of time and money are to be effected, and the hospital is to serve efficiently both the patients and the medical school. In the hospitals where this study was carried out, difficulties were found to be due in some instances to the weight of tradition. It is probable that in the hospitals in England this factor would be encountered much more frequently, and it is comforting to read that the author considers that even such difficulties are remediable. Dr. Bay has dealt with only a small part of the subject covered by the title of the book, and has treated that part so cautiously that the reader is tempted to ask for more.

THE BRITISH DENTAL ASSOCIATION

The meeting at Cardiff of the British Dental Association during the last week of August was a very successful event, and the discussions were longer and more animated than usual. Some prominent Canadian dental practitioners, visiting Cardiff on their return from the Orthodontic Congress at Paris, gave a transatlantic flavour to the debates, and, taking a leaf out of the book of the British Medical Association, the dentists decided to make Canada the scene of their next annual meeting, which will coincide with the meeting of the Canadian and Ontario Dental Associations. Mr. William Kittow's presidential address was a historical retrospect of dentistry in England, with many quaint and interesting touches, as, for example, an advertisement put out in 1746, by two practitioners in Racquet Court, Fleet Street: " Artificial teeth set in so firm as to eat with them, and so exact as not to be distinguished from Nature. They are not to be taken out at night, as is by some falsely suggested, but may be worn years together: yet are they so fitted that they may be taken out and put in by the person who wears them at pleasure, and are an ornament to the mouth and greatly help the speech." The problem of pulpless teeth was the subject of a keen debate, the opener of which, Mr. Frank J. Pearce, urged ionization as a means of treatment, and expressed the opinion that this process was even capable of combating sepsis in the periapical tissues. Mr. Owen C. Morphy suggested the need of revision of the drugs customarily sealed in the root canals of teeth if the healing process was not to be inhibited. Dental pharmacology, he said, was in need of drastic modernization. On the question of extraction, Mr. Frank Coleman said that he had rarely regretted the removal of a pulpless tooth, even when there was little or no evidence that it was acting as a foreign body, for in most cases he had found one or more of the roots to be discoloured or even necrotic. He pointed out that the treatment of pulpless teeth should be directed primarily to the living tissues surrounding the teeth, and not to the inert calcified matrix ; hence the periapical tissues should be treated as wounds, drained as long as inflammation continued, and thereafter treated as healed wounds or scars. A demonstration of the removal of teeth by hand pressure was carried out by Mr. F. N. Doubleday. As he pointed out, all ordinary extractions may be said to result in the removal of a tooth by hand pressure, but what he had in mind were those cases in which broken-down teeth or roots had been closed in by a covering of bone, and were only revealed by skiagrams. Removal with forceps was impossible, or could only be achieved by great trauma, and resulted in considerable after-pain and discomfort. He illustrated the removal of these buried roots and impacted teeth after the surgical excision of the alveolar process by chisels, operated by hand pressure. A special kind of chisel devised by Dr. Coupland of Ottawa was employed. The last day of the meeting was devoted to

a discussion on the dental aspect of ante-natal care, and the care of the pre-school and the school child. *Dr. Gilbert I.* Strachan dealt with the dental aspect of pregnancy, especially the question of diet. The best thing for the dental welfare of the pregnant woman and the expected child was for the mother to be on a diet rich in vitamin D, in calcium and phosphorus, and in irradiated material ; though if the diet were deficient in this respect the foetus would not necessarily be starved of these substances, as the mother would draw on her own store of vitamin D for its sustenance. But the maternal drain of this vitamin had two important effects: the mother became more liable to the development of dental caries on account of the acquired deficiency of vitamin D, while during lactation the vitamin D deficiency was found to produce defects in the developing infantile deciduous teeth. Mr. A. T. Pitts discussed the problem of the conservation of the deciduous dentition in the school child, and the indications for extraction, laying it down as a rule, rarely, if ever, to be departed from, that a deciduous tooth with an infected pulp should be extracted. A septic pulp in a permanent molar was also, in his opinion, an indication for extraction. Mr. J. W. Doherty spoke on the treatment of the teeth of the pre-school child, and mentioned some of the difficulties which this entailed for the dental surgeon, difficulties worth overcoming, however, in view of the immensity of the benefits that the possession of a sound deciduous dentition might bring. The question of the most suitable anaesthetic for children bulked largely in the ensuing discussion. Mr. George Northcroft held that gas anaesthesia for children was much to be preferred to the use of a local anaesthetic. He himself always favoured nitrous oxide, but it was necessary to be careful of the percentage of oxygen employed ; with children this might easily be overdone. A matter which aroused some controversy was the position of the dental officer in public schools and his relation to the private dental surgeon treating the family. Mr. Pitts and others urged that while it was very desirable that pupils in public schools should have their teeth inspected, the inspection should be carried out in such a way as not to invade the rights of the private dentist.

ENCEPHALITIS FOLLOWING VACCINATION AND CERTAIN INFECTIONS

At page 478 of our last issue (the Educational Number, 1931) we gave immediate publicity to an announcement by the Ministry of Health inviting the co-operation of medical practitioners in maintaining full investigation of the characteristics of acute disease of the central nervous system arising within four weeks of vaccination. Similar information is desired of the occurrence of cases of acute disease of the nervous system following such infections as measles, rubella, chicken-pox, whooping-cough, and influenza. Information of the kind requested, if received in time, will permit of local inquiry to ascertain clinical details which may not subsequently be obtainable. It may also, in some cases, enable the Department to arrange for expert post-mortem examination and pathological examination of specimens. All practising members of the medical profession are therefore asked, when attending patients suffering from disease of the central nervous system with an acute onset, to report to the Ministry as soon as possible every case in which they have ascertained that vaccination has preceded the onset of the symptoms within a period of four weeks, or in which the symptoms have immediately followed an acute infectious illness. The intimation should be sent to the Senior Medical Officer, Med. I., Ministry of Health, Whitehall, S.W.1.

INTERNATIONAL CENTRE FOR RESEARCH ON LEPROSY

At the first session of the Council of the League of Nations, held at Geneva on September 1st, the Brazilian Government made an offer to establish at Rio de Janeiro an international centre for leprosy research, and to place it at the disposal of the League. The cost of the establishment and upkeep will be met by a grant from the Brazilian Government, the League incurring no financial or other responsibility, though it may contribute up to a maximum of £2,000 towards the travelling expenses and allowances of specialists engaged to carry out investigations on leprosy. It will be the object of the centre, under the auspices of the Health Organization of the League, to undertake any work which may contribute, by means of epidemiological, clinical, and biological research, towards prevention and treatment. By means of a specialized course of instruction open to scientists, members of the medical profession, and hygienists of the countries which may desire to take advantage of such a course, the centre will also promote universal co-operation in the anti-leprosy campaign. The governing body administering the centre will consist of the members of the Health Committee of the League, with one representative of the donating Government. The cost of the installation, working, and upkeep of the centre is to be met by an annual subsidy from Brazil amounting to some £4,000, but gifts, legacies, and grants from Governments, institutions, or private persons will be welcomed. The duration of the engagement entered into by the Brazilian Government is five years, at the end of which time its extension or renewal may be proposed. A technical, administrative, and financial report on the work of the centre will be submitted each year by the governing body to the Council of the League and to the Brazilian Government. The offer was accepted by the Council, which tendered hearty thanks to Brazil for its generous action.

Sir William R. Morris, Bt., has made a gift of £25,000 to the British Empire Cancer Campaign for the foundation of a research fellowship in radiology, tenable at Mount Vernon Hospital, Northwood. We understand that it is intended to appoint to this fellowship a whole-time radiologist for the investigation of deep *x*-ray therapy, and that it is hoped to secure for the post a worker of such standing as to be eligible for a professorship in connexion with the National Radium Centre and Post-Graduate School of Radiotherapy.

A revised edition of the *Manual of the International List of Causes of Death*, as adapted for use in England and Wales, Scotland, and Northern Ireland, has been published this week by H.M. Stationery Office, at the price of 3s. It is based on the fourth decennial revision by the International Commission, held in Paris in 1929.

SIR CHARLES HASTINGS MEMORIAL FUND

To celebrate the centenary of the British Medical Association the Council has opened a fund for the purpose of establishing a permanent memorial to its founder, Sir Charles Hastings. The memorial will take the form of a stained-glass window in the cathedral at Worcester, a city with which Charles Hastings was intimately associated all his life; the placing of a tablet on the house in Worcester in which he practised; and the restoration and permanent upkeep of his grave in the Astwood Cemetery, Worcester. Any balance left over after these objects have been fulfilled will be given to the Sir Charles Hastings Fund, which is controlled by a small body of trustees, who have power to distribute the income for the benefit of individual members of the profession or their dependants in any way that the trustees may think fit. The fund has proved exceedingly useful in cases which do not come within the ordinary scope of the Royal Medical Benevolent Fund, and in cases in which there is urgent need for help.

The first list of contributors to the memorial fund was printed in the *Journal* of June 27th, 1931 (p. 1127). The Council appeals with confidence to members of the Association all over the world to contribute to this fund. The opening ceremony of the Centenary Meeting will be a pilgrimage to Worcester on Sunday, July 24th, 1932, when the unveiling of the memorial window and plaque will form an important part of the ceremonies of the day, which are already being anticipated with eagerness by the city authorities and by the public.

A second list of contributors to the memorial fund is appended.

Dr. G. C. Anderson	Dr. M. McKerrow
Mr. A. C. Devereux	Sir Robert Philip
Dr. A. Dey	Dr. B. H. St. Clair Roberts
Dr. J. Henderson	Dr. D. Ross
Dr. W. M. Hewetson	Dr. W. W. Shrubshall
Dr. R. Hutchison	Dr. H. Ferguson Watson
Dr. J. Lockhart Livingston	Dr. C. Wilson
Dr. D. McKail	Mr. T. Wilson
Dr. E. McKerrow	Dr. A. E. Wynter

Members are requested to send in their contributions (maximum £1 1s.) as early as possible, as the Council desires to close the fund as soon as the amount required for the objects chosen is reached. Cheques should be made payable to the "Sir Charles Hastings Memorial Fund," and sent to the Financial Secretary, British Medical Association House, Tavistock Square, London, W.C.1.

SAFETY IN THE FACTORY

CHIEF INSPECTOR'S REPORT

The annual report of the Chief Inspector of Factories for 1930,[1] which has recently been published, records that the total number of accidents during the year was 144,758. Fatalities numbered 899, a slight reduction as compared with last year, the decrease being most marked in those industries in which safety organization has been placed on a sound basis. The greatest number of fatalities in any one industry (125) again occurred in the building trade, in which there has been an increase in both fatal and non-fatal accidents. Many accidents on buildings are caused by want of thought, resulting in planks or pieces of wood with projecting nails being left lying about on floors, scaffolding, and staircases. Several illustrations are given of very successful work on the part of safety committees composed of members of the managerial staff and of workers. Under the heading of "Fire" instances are given of locked fire exit doors, and passages and stairways obstructed by packing cases, goods, or trade refuse. An example was a boot factory employing 139 persons, where one of the main exit doors was padlocked on the outside, and several of the subsidiary exits closed. In this case proceedings were taken, and the maximum penalty of £10 was imposed. The year was marked by a number of explosions arising from dusts, gases, vapours, and chemical compounds; one of these occurred in an oil-cake mill, and was responsible for eleven fatalities and injuries to thirty-two other persons; another occurred at a chemical works, and resulted in thirteen fatalities and injuries to about fifty other persons.

Very bad cases of illegal employment of women and boys are cited, brought to light no doubt by complaints, a useful table of which is given. They numbered 4,884, but only 1,801 were verified by the inspectors; operatives including trade unions, contributed 910. In order of frequency they related to questions of employment (1,112), defective ventilation (397), insufficient sanitary accommodation (265), lack of cleanliness (243), too low temperature (226), and insufficient fencing of dangerous machinery (152).

In the metal-grinding industries much has been done by regulations to remove the dust, but one inspector refers to the frequently careless way in which workers allow the throats of the ventilating hoods to become choked, and in a few cases even block them up deliberately. There are some interesting remarks on the manufacture and use of cellulose solutions in spraying motor-car bodies, locomotives, furniture, shop fittings, household goods, machine parts, etc., by the spray gun. Notwithstanding the memorandum and official leaflet published by the Department for the guidance of employers, and containing full particulars of the precautions recommended, the inspectors state that old plant still exists, and that the general supervision of working conditions and plant leaves much room for improvement. The defects found from time to time covered practically every one of the precautions specified in the official leaflet. Storage under dangerous conditions of large quantities of highly inflammable solutions in the workrooms was found to be not infrequent. Eight fires occurred in premises under the Petroleum Acts. In the eighth case the cause of the fire was difficult to determine, as the spraying room was completely burnt out. There seems abundant evidence of the need for regulations to control these growing processes.

In a chapter eulogizing the usefulness of the Home Office Industrial Museum in Horseferry Road, an inspector states that the sections of the museum which attract most interest are those appertaining to lighting, electrical and transmission machinery; of these the lighting section easily takes first place. Instances are given of how, as a result of a visit to the museum, conditions of lighting have been improved, work made easier, and eye-strain lessened.

The medical inspector refers to the useful coloured and illustrated pocket card on anthrax, remarking that it is primarily intended to put medical practitioners on their guard when confronted with an apparently simple pimple in a worker exposed to infection. Useful details of each of the 43 cases (6 fatal) of anthrax notified are given, bringing out the advances made in treatment by anti-anthrax serum injection instead of excision. The total number of cases of skin cancer was 194 (36 deaths), of these 82 (21 deaths) occurred among cotton mule-spinners. The advantages of [illegible] medical examinations, could they only be made general, are shown by the results among the patent fuel workers of Cardiff, where men of 30 years of age and over who have been employed for ten years were examined by the certifying

[1] H.M. Stationery Office. (2s. 6d. net.)

surgeon, to the number of 257. Twelve growths were detected, two of which showed the characteristic appearance of epithelioma. Voluntary periodic medical examination of workers in tar distilleries is now carried out in eighty-six works and in fifteen gas companies' works.

The incidence of dermatitis is stressed, there having been 789 voluntarily reported cases during the year. A warning is issued that a large number are due to the methods of cleansing the hands after work. It is difficult to remove stains from the hands without damage, but a very great measure of safety is provided, it is said, if the following routine is observed: (1) Where practicable, coat the skin with a film of ointment before handling materials that will stain. (2) Whatever cleansing agents are employed, use as weak as is compatible with efficiency. (3) Wash very thoroughly and at once after the stains are removed, and apply a small quantity of ointment. Of these it is perhaps the third that is the most important.

Reference is made to the traumatic angioneurosis of the capillary vessels of the fingers (resulting in Raynaud's disease) among men engaged on "pounding-up" machines in the boot and shoe industry—a condition similar to that resulting from the use of pneumatic drills. "Dead hand" is produced by grasping the last, which is necessary in holding the boot against the rapidly vibrating jigger. The remedy can be found only in some new type of machine. Far more attention appears to have been paid to this subject in Germany than at home, largely, no doubt, because incapacity from the effects is included in the schedule of industrial diseases for which compensation can be claimed.

Nova et Vetera

A SURGEON TO THE DUTCH EAST INDIA COMPANY IN THE SEVENTEENTH CENTURY

In 1677 Christopher Fryke, surgeon and member of a medical family of Ulm, in Würtemberg, yielding to an overpowering curiosity and desire of travel, left his home and spent the best part of three years travelling in Hungary and Central Europe, until about Christmas, 1679, he found himself in the famous city of Amsterdam. There he applied for the post of surgeon to the Dutch East India Company, and, after examination with twelve other candidates, he was fortunate enough, as he thought, to be one of six chosen, despite his youth. He was so anxious to see the world that, failing an appointment as a surgeon, he would have shipped in almost any capacity. An English translation of a Dutch version of his journal, "A Relation of a Voyage made to the East Indies by Christopher Fryke, one of the Surgeons to the E. India Company, from the Year 1680 to the Year 1686," has lately been published in the Seafarers' Library.

The Dutch Company of the East Indies was at this time at the height of its power and wealth, and altogether overshadowed the English Company, which it had practically ousted from the trade of the Spice Islands and Ceylon. Such a small country as the Netherlands could not, however, man all the ships, fill the ranks of the armies and the gaps made by disease and casualties, out of its native population. Many foreigners were employed, and the means of recruitment did not differ a great deal from those employed much later by crimps and kidnappers in other lands. But the ship surgeons were important persons, in whom obviously the crews put great confidence, just as the buccaneers did in the West Indies (see Nova et Vetera, *British Medical Journal*, 1922, ii, 397; 1927, ii, 511; 1928, ii, 113).

Each East Indiaman carried a physician, a surgeon, and a mate who served as a barber. The physician's pay was the equivalent of £2 16s. a month, with a subsistence allowance ashore of 15s. a month. In 1658 the English Company at Surat were paying to chaplains and surgeons £50 a year, with full board and lodging, and facilities for private trade such as the Dutch did not allow.

Fryke was engaged for the usual five years, and sailed from the Texel on the ship *Ternate* on the last day of May, 1680. He gives interesting details of the discipline and internal economy of the ship. Punishments were cruel. Keel-hauling, running the gauntlet, and nailing the offender's hand to the mast with a knife till he chose to pull it away were some of them.

His ship was wrecked in False Bay, near the Cape of Good Hope, and only 43 out of 343, including Fryke and two other surgeons, came safe to land. He gives an interesting account of the Cape Colony, but describes the Hottentots as particularly loathsome savages. He makes no mention of other natives. He arrived at Batavia at the end of November, six months after leaving the Texel. On arrival he was sent to a fort, for the terms of his engagement bound him to serve on land as well as at sea. Consequently he saw a good deal of fighting at and after the capture of Bantam by the Dutch, and on one occasion he was, so he says, made captain of the ship *Europa*, which had 800 men and three surgeons. Of the attack on Bantam he wrote:

"I went down into the boat with the other surgeons which were about seventy in number upon our vessel, which was attended always by two or three small boats, that were ready in case of any wounded, that they might carry them off to any other place and upon ever so shallow a water."

After the capture of Bantam he was put in charge of the wounded ashore.

"So I took my lodging in the *Chinesen Straet*, where I was very commodiously seated for my business. There were also two assistants with me and three Under-Surgeons, who were lodged in their several quarters, for the better looking after their patients. Those were obliged to come to me ever and anon to give me an account of those they had under their hands, and to fetch the remedies, which were all in my custody, and to take my directions. Only those other necessaries, as linen for plaisters, Arack, Sack, Olive Oil, and such like were to be fetched from the Steward who had them in keeping; but they were never delivered without I sent a special order under my hand. The number of our sick and wounded was great, and that of the former increased by reason of the Flux, which was very rife amongst them; and some were seized with a lameness in all their limbs; so that we had enough to keep us in employment."

During his engagement to the Company, Fryke saw a great deal of fighting, and travelled to Japan and to Ceylon and most of the Dutch settlements. He gives an interesting account of pearl diving, with and without a diving bell. In one skirmish he was wounded in the leg, and the bullets could not be extracted till after his return to Holland. His account of native cruelty in Java and Sumatra is revolting, but the Dutch reprisals did not lag behind in barbarity. By the time his ship reached Holland his leg was giving him great trouble, so that he had to be carried ashore. He says:

"My pain increasing rather than diminishing, and I growing daily worse and worse, I sent for a Doctor and two Chirurgeons, not willing to trust to my own skill only. And being I was not able to go and receive my money myself, I was obliged to send a person to the *East India* chamber to receive my money and goods by virtue of a letter of Attorney which I gave him. The money that was due to me from the Company did not amount to more than 4 or 500 Ducatoons which was all the fruit of my labours; except some considerable East India goods I had brought over on my own account, which I had to sell; But by that time I had satisfied my Attorney, my Doctor and the two Chirurgeons, and defrayed the rest of my charges, I found my bag very light. My Doctor did not cost me above forty Dutch Gilders: the two Chirurgeons who were two of the most famous artists in the whole city of Amsterdam, had eighty Rixdollars; they had

taken out my two bullets and cleared the bone of above twenty splinters great and small for my lodging I paid two Rixdollars a week and had but a very poor accommodation neither The Apothecary, too, came in with a hideous bill"

He managed at last to get to Cologne, whence he ascended the Rhine and got home at last by Frankfort to the "city where I was born," nine years after he first left home for Vienna Although he does not say so, we infer that his thirst for adventure and travel was assuaged

E M L

Scotland

New Glasgow Professor

On the recommendation of the Secretary of State for Scotland, Dr John Glaister, jun, professor of forensic medicine in the University of Egypt at Cairo, has been appointed to the chair of forensic medicine in the University of Glasgow The new professor is the son of the present occupant of the chair, and his appointment takes place as from the end of this month After receiving his early education at Glasgow High School Dr Glaister graduated M B, Ch B at the University of Glasgow in 1916 From 1916 to 1919 he served with the Royal Army Medical Corps, and afterwards was appointed assistant to his father In 1926 he took the M D degree with honours, and in the same year qualified as a barrister at law of the Inner Temple In the following year he took the degree of D Sc at Glasgow University, and in 1928 was appointed professor of forensic medicine in the University of Cairo, as well as medico legal adviser to the Egyptian Government Among his publications is a work entitled *Legal Medicine*, published in 1925

Study of Child Development

Professor Stuart A Curtis of London, who recently conducted an investigation among the Dunfermline school children, has written a letter to the Carnegie Dunfermline Trust expressing his thanks for the facilities afforded to him by the trustees In it he states that he has conducted similar surveys in London, Geneva, and Rome and that the material received from Dunfermline came through in better shape, more quickly, and at less cost than in any of the other three cities He pays a tribute to the work in this connexion of Dr Mackenzie chief medical officer of the Trust In one particular only was he disappointed Very full data were available up to 1928, when the cards passed from Dr Mackenzie's control to that of the public authority Since then the records have been imperfect and in marked contrast to those for which the trustees had made themselves responsible In Professor Curtis's judgement, this is a clear illustration of the fact that research work carried on by trust funds must be continued to the point where it has proved its worth before being transferred to public control He considers that "the Carnegie Dunfermline trustees will confer a benefit on the entire world if they will carry through an organized series of dental, physical, mental, and social development records for the children in its unique community"

Highlands Medical Services

A question was recently raised in the House of Commons by the Right Hon Ian Macpherson, M P for Ross and Cromarty, regarding the facilities in the houses of doctors in the Highlands and Islands for waiting rooms and rooms in which minor surgical operations could be performed Mr Westwood, late Under Secretary of State for Scotland, prior to demitting office, addressed a letter to Mr Macpherson, in which he agreed that the Department of Health for Scotland would provide, in houses already existing or to be erected in accordance with the Department's plans, porches of sufficient size to accommodate two or three persons, while for surgical operations the doctor's consulting room would be suitably arranged as part of the normal accommodation provided in doctors houses erected with the assistance of the Department

Ayr Hospital Memorial

A memorial was recently unveiled at Ayr County Hospital to Dr John Finlayson McGill Sloan, *V C*, who graduated M B at Glasgow University in 1912, and had practised at Alloway Place, Ayr He had been honorary surgeon to the hospital, and had devoted special attention to the training of the nurses in the institution The memorial consists of a bronze wall tablet mounted on oak, bearing an inscription 'In Memory of Dr John F McGill Sloan, Lecturer in Surgery to the Nurses in training in this Institution, from 1911 to 1931 Erected by the Nursing Staff" The unveiling ceremony was carried out by Colonel W T R Houldsworth, president of the hospital board

England and Wales

Mental Diseases Research in Birmingham

Further developments of the work in which the Joint Board of Research for Mental Diseases set up by the City and University of Birmingham has already made its name are outlined in the annual report of the laboratory for the year ending March 14th, 1931 In all, 5 367 specimens for bacteriological examination have been examined and reported upon by the laboratory details of which are given in Table I The work has necessitated the manufacture and use of 42 500 tubes of media and 5,470 plates of culture media an average of 3 500 tubes and 456 plates per month Research into nasal sinus bacteriology accounts for the greater part of these In brain has been examined for organisms in suitable post mortem cases 24 specimens from 12 cases showed that 15 aerobically and 22 anaerobically were sterile The organisms which have been found vary considerably in individual cases and so far are of little value as positive evidence A year's subculturing of organisms in media containing potassium iodide did not alter their Gram-staining characteristics A new method of the examination of faeces for typhoid dysentery organisms, by intraperitoneal injections of specially prepared material into mice, is being studied Further work on agglutination tests has been carried out, and it is hoped to collect the results for publication shortly In the histological department, serial sections of the carotid arteries and adjacent tissue from three cases have been examined for Gram positive organisms, the findings being recorded by sketches A further twelve specimens of sphenoidal sinuses have been examined for Gram positive organisms A large number of tonsils removed at operation have been sectioned and stained As the result of a large

haemorrhages. Chemical experiments have been continued on the resistance of red blood corpuscles to haemolytic agents under varying conditions, and the permeability of the corpuscular envelope to inorganic substances and dyes has been quantitatively investigated. By the use of masses of raw white of egg the permeability of colloid albuminous substances without lipoidal envelope has also been determined. An attempt is being made to separate viruses from brain mash obtained post mortem by cataphoresis, using haemoglobin as an indicator. Since it is known that during malarial treatment of general paralysis of the insane, a temporary increase in the permeability of the brain membranes occurs, a series of experiments has been undertaken to show whether heat alone causes such increase. After treatment with bromide, rabbits were kept for varying periods in a warm chamber. Results so far seem to indicate an increase in permeability due to simple heat effects.

Eversfield Chest Hospital, St. Leonards

Lord Brentford, president of the Eversfield Chest Hospital, inaugurated a new annexe to this institution on August 27th. Since the hospital was opened in 1891, with fifty-three beds, a number of alterations and additions have been made at various times, including an extension to the east wing in 1923. The annexe was formerly the neighbouring Railway Mission Convalescent Home, which was offered to the committee with its furniture and fittings at a figure a little above that intended to be expended on a new small wing. The committee proposes to transfer to the annexe all women patients and to reserve the wards of the hospital itself for men. Altogether there will be accommodation for about a hundred beds. Small wards will be available for private patients, and beds will be provided for women on the ground floor. The purchase price and cost of reconstruction have amounted to about £6,000. According to the forty-sixth annual report of the hospital for 1930, a deficit of £295, with which the year opened, had not been fully covered, although the financial statement showed a credit balance on the year's work. In appealing for annual subscriptions and donations to its general fund, and for assistance to meet the cost of the latest extension, the committee reminds subscribers of its endowment fund, which is intended to provide free treatment in appropriate cases. Up to the present the hospital possesses only one permanently endowed bed and one partly endowed.

Conference of Cremation Authorities at Ipswich

The tenth annual conference of the Federation of Cremation Authorities was held at Ipswich from June 19th to 23rd, when a wide range of subjects of medical interest was considered. Mr. J. A. Sherman, architect to the Ipswich Burial Board, read a paper on the construction of crematoriums, in which he mentioned that the up-to-date local crematorium had cost just over £6,000, apart from the expenses incurred in respect of gas mains, roads, fees, and local charges. Crematoriums, he urged, should be kept away from cemeteries, and should be situated in pleasant surroundings. It was a curious fact that, while earth graves were often permitted within a dozen yards of a dwelling, yet a crematorium, which eliminated the possibility of putrifying matter and the discharge of noxious gases, might not be brought within 200 yards of a house. It would seem desirable to reduce this distance to not more than 50 yards. The type of furnace should be definitely determined before work was commenced on the plan, and gas was probably the best means of heating. Dr. A. M. N. Pringle, medical officer of health for Ipswich, maintained that the management of cemeteries was essentially a public sanitary duty, and should be in the hands of the local authority. The public required education in the advantages of cremation, and teaching might well be given during "health week." In a paper on cremation and crime, the late Professor W. E. Dixon dealt in detail with the objection that cremation might destroy evidence in suspected cases of poisoning. He was satisfied that under the precautions at present adopted in this country such an objection was no longer valid. From the point of view of the public, it was obviously better to take such measures as would enable poisoning to be discovered before burial. Even though a miscarriage of justice might occur once or twice in a century, he was convinced that the immense benefit of cremation to the community definitely outweighed the possible risks. He firmly believed that cremation protected the public against poisoning, since the necessary legal inquiry was of such an exhaustive nature.

University of London Officers' Training Corps

The medical unit of the University of London Officers' Training Corps (Senior Division), which consists entirely of students of the London hospitals, with members of their staffs as its officers, camped at Shorncliffe from July 12th to 26th, together with the other units of the Corps. Special attention was devoted to first-aid and bandaging, care and transport of the wounded, and sanitation and hygiene, with a certain amount of squad and stretcher exercises, and considerable field medical and tactical work. Two or three days were spent some little distance from the camp practising the establishment of advanced and main dressing stations, full use being made of the equipment available under war conditions. The contingent was inspected by the Chief of the Imperial General Staff and by the Deputy Director-General of Medical Services. Such training is obviously of value to students who intend to enter any of the medical units of the Services.

London Ambulance Service

The total number of calls received by the London ambulance service (accident section) during the year ending March 31st last was 43,746, or 432 fewer than during the previous year, which had constituted a record. The average time taken to reach cases was 6.5 minutes, and the average time which elapsed between receipt of a call and the arrival of the case at hospital was 13.6 minutes, in both respects a gain in speed upon the figures for the previous year.

Ireland

Vital Statistics for Northern Ireland

In his report for the quarter ended June 30th, 1931, the Registrar-General states that the annual birth rate for the quarter was 22.5 per 1,000 of the population, as compared with rates of 16.5, 20.0, and 20.6 for England and Wales, Scotland, and the Irish Free State respectively. Births in Ulster numbered 7,005. The death rate for the quarter was 14.5 per 1,000, as compared with a rate of 13.8 for the corresponding quarter of last year, and a rate of 15.6 for the average of the second quarters of the ten preceding years. The corresponding rates for England and Wales, Scotland, and the Irish Free State were 11.5, 13.2, and 15.3 respectively. Deaths in the province numbered 4,502. A slight decrease in deaths from tuberculosis and a marked increase in deaths from cancer were recorded during the quarter, as compared with the figures for the corresponding quarter of 1930. Deaths from enteric fever, whooping-cough, diphtheria, and influenza showed a fairly appreciable decrease, compared with the average number in the corresponding quarters of the five preceding years; but deaths from measles, as in the previous quarter, were still high. The measles epidemic, however, seemed to be

declining, since the notifications of this disease in Belfast county borough during the quarter numbered 748 as against 3,634 in the previous quarter.

National Health Insurance and the Poor Law (Northern Ireland)

At a recent meeting of the Ballymoney Guardians a circular letter from the Ministry was read stating that cases had been brought to its notice in which insured persons had been recommended by panel doctors for surgical appliances which were not on the list of approved appliances procurable out of the National Health Insurance funds, and that while the guardians were relieved of any responsibility for providing medical treatment for insured persons in so far as they were entitled to receive it under the Act, it was nevertheless the duty of the Board to provide medical treatment not so covered by any insured services. If the patients were in poor circumstances, necessary appliances would have to be provided by the guardians. A small committee was appointed to go into the whole matter of the running of the hospital and of medical fees.

Health Insurance

Notice has been given in the *Belfast Gazette* of a proposed new Order to come into force next January, relating to certain classes of employment which are excepted from compulsory insurance on the ground that they are ordinarily adopted as subsidiary employments only and not as the principal means of livelihood. The new Order aims primarily at removing certain difficulties which have arisen in interpreting the present Order. For example, church officers, sextons, and lamp-lighters have hitherto been excepted from insurance if employed for part time only. Difficulties have arisen owing to the absence of any definition of part time, with the result that a number of persons who derive their main source of livelihood from these employments have been deprived of the benefits of the health insurance and pensions scheme. Under the new Order these persons will be insurable if they are employed for a specified number of hours in the week. The Order makes a change in the position of cinema and theatre attendants, who will, as in Great Britain, be excepted from compulsory insurance unless the weekly hours of employment amount to twenty-eight or more, or unless they are employed before 6 p.m. for four or more hours during the week. A copy of the draft Order can be obtained by any person affected on application to the Ministry of Labour, Stormont, Belfast.

Tyrone Hospital

At a recent meeting of the Dungannon Rural Council the chairman said he had read with much concern that part of the Tyrone County Hospital might be closed owing to lack of funds. It would be shameful if any part of the building had to be closed and if such an up-to-date hospital was not financially supported. The chairman of the Tyrone County Council (Colonel R. J. Howard, J.P.) mentioned that the County Council had contributed £4,200 every year to the upkeep of the hospital, while it was entitled to contribute only £1,400. Last year it gave an additional sum of £2,200 to balance the accounts of the hospital, and it was understood that that would be the last extra payment required. In referring to the splendid work that had been done by the County Hospital, the clerk said that patients were being sent from all districts for special treatment. A deputation was appointed to put the situation before the County Council. In the meantime it was decided to issue paying orders for the salaries and wages of the hospital staff amounting to about £900 and to withhold the paying orders for the contractors amounting to £1,000.

Correspondence

RADIOLOGY AND THE RADIOLOGIST

SIR,—Your illuminating article in the *Journal* of August 29th "gives the radiologist furiously to think," and possibly may stimulate him to gird up his loins for the future. I am not a pessimist about the future of radiology in this country. As, however, in the natural course of events, I must before many years be *hors de concours*, I have yielded to the wish of many colleagues to ask you to permit me to make some comments upon your annotation, not by any means in the nature of criticism, but as the cogitations of one of many radiologists still living who have watched the growth of radiology from its birth. We have seen the indispensability of radiography in every department of medicine. We have also seen how inevitable it was that its uses could not be confined to those of us who have taken it up as a specialty. We have, however, regarded such further use much as we should regard the use of the laryngoscope or the ophthalmoscope by the clinician—*as an aid to him in* his daily work, but not with any idea that he would wish to perform endolaryngeal or ophthalmic operations.

In the one sentence towards the end of your article I find the kernel of the whole matter. You say: "But there is also interpretation." The present is an age of team work, and the *summum bonum* of the patient is found in this way. May I take one instance of what is in my mind? Radiography of the chest is full of pitfalls, even for the most experienced, be he clinician or radiologist. Supposing (and I admit the assumption) the radiologist to be at fault in his interpretation, the patient still has behind him to act as a corrective the clinician, with his greater knowledge of history, physical signs, and symptoms. But supposing the clinician, and especially the consultant, acts in the double capacity, is he of necessity so much of a superman as to be inhibited from making similar errors in interpretation? What, then, is the position of the patient? Deprived of the judge, who can sum up all the evidence? The only court of appeal is a change of consultant, and this would be a pity.

Recently I have had the good fortune to come in contact with a consulting physician who makes use of *x* rays to aid him in such things as the control of artificial pneumothorax. He had made a screen examination, and found sufficient evidence to justify further examination by a radiologist, the only proviso being that the latter should be one experienced in the radiography of the chest. There is the clinician of one's dreams—namely, the man who uses *x* rays much as he would use a laryngoscope. Naturally, the warning note in your article as to over-exposure must be taken into account.

I am well aware that the necessity is laid upon the tuberculosis officer, for example, for doing his own radiography. I still maintain that this does not vitiate my argument, for there are many ways in which this can be done to the greater advantage of the patient. Thus (*a*) the tuberculosis officer may, as several already have done, take one of the university diplomas in radiology, (*b*) work in collaboration with another clinician, (*c*) attend special courses at a chest hospital.

Many years ago I was fortunate enough to be the radiologist in a hospital where my work [illegible] contact with a physician who taught me to [illegible] graphy from the point of view of the [illegible] the pathologist. Would there were more such [illegible] There would be but little fear of the clinician complaining of the failure of the radiologist to give the help needed. The training of the radiologist of the future is no simple matter to-day, and the technical and other knowledge

required is very great. Is all this great work to be allowed to go for nothing in the one country in the world that has appreciated the necessity for proper training in the subject of radiology?—I am, etc.,

London, W.1, Sept. 5th. STANLEY MELVILLE.

CARDIAC PAIN

SIR,—In your review of Dr. White's recent monograph on heart disease (August 29th, p. 391), an assertion is made that requires comment. Dr. White's statement that true angina and the pain of neuro-circulatory asthenia may coexist is criticized, and in support of the criticism Gallavardin is cited as follows: "Sans pouvoir catégoriquement nier sa possibilité, je puis bien dire que je n'ai pas observé d'angor d'effort absolument net dans l'angine de poitrine névrosique." This citation is apparently from Dr. Gallavardin's monograph, *Les Angines de Poitrine* (p. 98). Reference to the context shows that Dr. Gallavardin makes no such assertion as that attributed to him by your review. The paragraph, from which this isolated sentence has been quoted, means that the pain of neurotic angina never has the precise relation to effort that the pain of true angina has. In the next paragraph he states that the absence of this precise relation to effort is not exclusive to neurotic angina, as many patients with true angina do not have pain induced by effort.

I have certainly seen cases of typical left mammary neuralgia in which true angina developed or coexisted. Neurotic subjects may have angina pectoris, and, when they do, diagnosis may be really difficult. I believe, Sir, that all with much experience of angina pectoris will agree with Dr. White, and admit this difficulty.—I am, etc.,

London, W.1, Sept. 2nd. D. EVAN BEDFORD.

*** Dr. Evan Bedford's point arises from a phrase which was perhaps inexplicit in the review. The "painful forms of neuro-circulatory asthenia" referred specially to the group designated by Dr. Gallavardin "angor névrosique." Dr. Gallavardin distinguishes carefully between this clinical entity and the milder forms of infra-mammary pain; he takes a non-committal attitude regarding its possible association with true angina, and refrains from discussing this problem. A major theme in his monograph is the differentiation of these syndromes, and the reviewer considers that attention might have been directed by Dr. White rather to this vital matter of differentiation than to problematic association.

BREECH PRESENTATION

SIR,—As the outcome of the records quoted by Mr. Gibberd, and printed in the *Journal* of August 29th, may I record the statistics for breech deliveries during twenty years at this hospital?

Clapham Maternity Hospital, 1911–30

Total breech deliveries 511: primiparae 320, multiparae 191.
Total stillbirths 90 = 17.6 per cent.
Neo-natal deaths 34 = 6.5 per cent.
Stillbirths: In primiparae 51 = 15.9 per cent.; excluding macerated 13.2 per cent.
Stillbirths: In multiparae 39 = 20 per cent.; excluding macerated 16.2 per cent.

TABLE I

	Total Cases	Foetal Deaths Per cent.	Neo-natal Deaths Per cent.
Uncomplicated breech ...	311	6.1	4.1
Complicated breech ...	206	31	7.7

TABLE II

	Total Cases		Stillbirths Per cent.		Neo-natal Deaths Per cent.	
	Prim.	Mult.	Prim.	Mult.	Prim.	Mult.
Uncomplicated breech...	231	80	6	6.3	3.4	6.2
Complicated breech ...	88	118	31.8	20.3	12.5	8
Twins	6	9	33⅓	nil	nil	nil

Among the uncomplicated breeches are included all presentations, complete or incomplete; and also included in this group are all cases of slight disproportion or of contracted pelvis. No contracted pelvis is included among the "complicated" group, but only associated complications, such as placenta praevia, transverse presentations, prolapse of cord, etc. The difference so marked may be partly accounted for by the increased neo-natal death percentage, but even allowing for this there is a surprising difference in the figures, which it is difficult to understand. Every breech extraction takes place in the presence of a doctor or midwife well experienced in breech deliveries. I do not know if this is the practice in all maternity hospitals.

The statistics are reproduced by kind permission of Dr. Annie McCall.—I am, etc.,

E. JOYCE NEWTON, M.B., M.M.S.A.
Clapham Maternity Hospital, London, S.W.4,
Sept. 1st.

SIR,—The articles appearing on this subject in the *Journal* of August 29th are very helpful and informative, but there is a seeming contradiction between the statistics of Messrs. Gibberd and Bourne *re* foetal abdominal injuries. The former states that he had only one such case in over six years' post-mortem examinations at Guy's Hospital, while the latter declares them to be present in nearly all cases. He quotes Herbert Spencer as his authority, but I think we should have more specific information from Mr. Bourne on this point. I am inclined to agree with Mr. Gibberd about the infrequency of abdominal injury; I am of opinion that handling of a nature sufficient to pulp the child's kidneys and suprarenals is not midwifery but murder.

I cannot grasp Mr. Bourne's point about the extended legs not splinting the body and preventing curving; I am sure they do. In the natural position of the child in the uterus the legs and arms are flexed in front of the body, more or less guarding the "mark," to use a boxing term. This position prevents the uterus from forming the uniform envelope that occurs when legs and body are one mass, as in extended leg cases. The legs themselves may not form a splint, but extended legs, plus the closely fitting uterus, assuredly do.

As regards insufflation, I think any cord compression causes respiratory efforts in the child. This may occur while yet the head is in the uterus, and there is nothing then to prevent liquor amnii being insufflated. In fact, it does undoubtedly occur.

I also think it wrong to saddle the practitioner with the intracranial injuries. They occur in both vertex and breech cases which have not been handled at all. To a great extent they are due to uterine pressure acting on a difficult exit. Anyone who has experienced the surprising force with which the uterus can grasp one's contained hand cannot doubt the ability of the uterine muscle to tear the tentorium, etc. I would like Mr. Bourne to provide more particulars about the manœuvre he learned from Potter. As I understand him he is holding the child's feet in one hand. He has therefore only one other hand, which is in the vagina, wedged between the baby and the maternal parts. The patient is a primipara—tight fit—and the arms are extended above the baby's head and the uterus is shut down on all its contents. Mr. Bourne states that one hand, in these conditions, can push the angle of the scapula downwards and inwards, firmly and gently, and so bring the humerus down to grasping position. I am lost in admiration of that hand!

It seems to me to be wrong, and risking a fracture, to do anything to the humerus at all. Slip the hand gently, slowly, and boldly along the arm till the child's forearm

is reached, then sweep that downwards and inwards across the child's body, and so bring the arm down —I am, etc,

Glasgow, Sept 1st JAMES COOK M D

THE CAUSE OF TORTICOLLIS

SIR,—Mr G F Gibberd, in his admirable remarks on breech presentation in the *Journal* of August 29th, while referring to one matter of orthopaedic interest—namely, the origin of Little's disease—omits all mention of an equally interesting one, the origin of 'sterno mastoid tumour" and wry neck

I do not wish to take up your valuable space unnecessarily, but I should like to place on record the fact that eight out of ten cases of non spasmodic torticollis met with in my clinic at the Miller Hospital have occurred in children born breech first This proportion is far too high for it to be a mere coincidence Has Mr Gibberd any theory to offer which will explain the connexion between the two? The usual one given is that the chin catches on the pelvic brim, and the strain tears through the sterno mastoid muscle But this does not account for cases which occur where the birth has been normal My own view is that the "sterno mastoid tumour' is due to a tear, not of a normal muscle, but of a previously contracted one May it not be possible that the same cause, whatever it is, may produce the breech presentation and the shortened muscle?

An added reason for thinking that the child with the ruptured sterno mastoid muscle is not normal is that when the condition is recognized within a few days of birth one notices that the asymmetry of the face—one of the clinical signs of torticollis—is also present —I am, etc,

London W 1, Aug 28th PAUL BERNARD ROTH

CONVULSIONS DURING ETHER ANAESTHESIA

SIR —Dr Haworth's description, in the *Journal* of August 29th, is typical There was no cyanosis, but oxygen was given from the commencement Oxygen seems to be the crux of the whole situation, why is it given, and what is the effect? Oxygen is given to relieve cyanosis What is the cause of the cyanosis? If the air way is free, and there is no other interference with respiration, it is due to deep anaesthesia If the dose of ether is reduced and, if necessary, more air given, the cyanosis improves Again, does oxygen assist in the elimination of CO_2 which is causing cyanosis in the deeply anaesthetized subject? The colour will improve, but does the tension of CO_2 in the venous blood become less?

Convulsions appear to resemble the second stage of asphyxia While oxygen is being given to a deeply anaesthetized subject, is the patient being asphyxiated? The hyperpnoea of asphyxia is indicated by the rapid, shallow respiration; in the same stage the pulse rate increases enormously This is also noticed in the first stage of convulsions If the same dose of ether and oxygen is continued, convulsions commence In the former case we are dealing with an occluded airway and responsive muscles, in the latter, with a deeply anaesthetized subject with a free airway but a semi paralysed respiratory centre and muscles In each case convulsions are being caused by an excess of CO_2, and not by lack of oxygen Toxaemia evidently lessens the resistance of the respiratory centre, and, consequently, convulsions are most common in this type

In conclusion, I would like to stress the following points 1 Always attempt to rectify cyanosis without oxygen, which is not harmful, but masks cyanosis Given from the commencement, there is no cyanosis and the anaesthetist is on false ground (2) Should the effort of using bellows on the Shipway be too tiring, use compressed air and not the oxygen cylinder (3) Convulsions are probably due to careless anaesthesia and can be avoided —I am, etc,

Burbage Vale, 31st

A SIMPLE METHOD OF EMBALMING

SIR —Noticing in the *British Medical Journal* of August 22nd (p 358) an article suggesting that ship surgeons might be called on to embalm bodies on board ship, and knowing how frequently it has to be performed by men practising abroad, I thought the following notes might be helpful

First of all plug lightly the pharynx and each nostril with cotton wool Push the plugs fairly far back into the nostrils Then heat some paraffin wax in a small enamelled jug (the wax requires to be fairly hot so that it does not harden too quickly) If necessary open the mouth with a gag then take a small funnel and pour the paraffin through it into the pharynx putting in about one and a half ounces Next pour a small quantity down each nostril In a few minutes the wax sets and completely seals the nasopharynx It is essential to do this as otherwise the formalin, when injected under pressure, always escapes through the mouth and nose Next expose one of the femoral arteries and tie a metal or glass cannula firmly into it, then attach about seven or eight feet of rubber tubing to it and a metal or glass douche can to the other end Raise the douche can to a height of about five feet and fill with full strength formalin allowing it to run slowly and filling up as necessary Half to one gallon is run in allowing four or five hours for this if possible I generally opened a superficial vein in the arm to prove that the formalin had circulated When the required amount has run in tie off the femoral artery above the cannula and stitch up the wound

I was able to prove the efficacy of this method, as two bodies I had treated were left in a mortuary chapel for six weeks during the heat of the summer in Southern Italy, pending the arrival of relatives I went and inspected the bodies at the end of that time, and found them both looking as fresh as the day the injection was done —I am, etc,

Dulwich S E 22, Aug 22nd

HUNGER PAIN AND PRESERVATIVES

SIR,—In a recent leading article on duodenal ulcer and pyloric gastritis reference was made to the acidity of the stomach contents About five years ago, in your correspondence columns, I recorded a form of indigestion that, after much endeavour, was finally tracked down to preservatives in food During war service I experienced symptoms simulating a duodenal ulcer The usual tests were made, and, while surgeons recommended a short circuit, I accepted the advice of physicians relying upon medicinal and dietary measures Almost no improvement resulted until food containing preservatives was excluded, then the attacks ceased So long as the food is pure the trouble does not return, but anything containing preservatives occasions the old symptoms They are always identical, and consist in a tenderness in the epigastrium with pain in the stomach, relieved by food constipation being also a feature To no article of diet is my stomach sensitive, and I can eat the most indigestible of things without any after effects, but my susceptibility to preservatives still remains On innumerable occasions during the

past few years have I been given adulterated food under the guise of pure, but never has my stomach failed to detect the difference. Nor does my sensitiveness to preservatives lessen, and only by excluding them can I purchase freedom from a form of indigestion that simulates duodenal ulcer. It is an immunity that is not easily secured. To follow a dietary involves little trouble, but to avoid preservatives requires greater supervision, and from the kitchen must be banished much which the modern cook uses. My butter comes straight from a farm; margarine and lard are taboo, as are also the various flavouring and thickening agents, and the only prepared foods that are used are made at home. By these precautions my chronic indigestion has been overcome, though I again pay the penalty when sojourning in hotels or partaking of restaurant food. Whether my hunger pains are an expression of hyperacidity, excessive motility, or of a pyloric inflammation may be a matter of contention, but on one point there can be no doubt, and that is their cause. This sensitiveness to preservatives, which nothing modifies, is striking, and that others in a varying degree are similarly susceptible is highly probable. The similarity of the symptoms to those of a duodenal ulcer is of significance. Being an oculist, the subject is outside my professional sphere, but I again bring my experience to the notice of those whose study it is.—I am, etc.,

London, W.1, Aug 27th. JAMES FORREST.

Dr. BENDIEN'S CHEMICAL TEST

SIR,—The focusing of interest on the spectro-photometric part of Dr. Bendien's test appears to have overshadowed, for the time being, the chemical part of the test. Considering the cost of the apparatus required to carry out the former—Adam Hilger Ltd. offer an outfit for £384—and in view of the probability that the information yielded by it may not exceed that offered by the chemical test, it is probable that the latter will become more extensively used should the contentions of Dr. Bendien become generally confirmed.

A large scale investigation is at present being carried out at the County Laboratory, Stafford, the results of which will be published later. The results of the first batch of four tests are, however, of sufficient interest in themselves to justify preliminary notice. It was arranged that this batch, which was numbered 1 to 4, should include one blood from a case of cancer. The result of the Bendien test was: No. 1, positive; Nos. 2, 3, and 4, negative. A comparison of the results with the clinical diagnosis showed a discrepancy, since blood No. 2 had been taken from a case of cancer. Further investigation, however, showed as follows.

Blood No. 2 was taken on August 31st from a case of carcinoma of the breast of two years' duration. The breast had been removed two months ago (June 29th, 1931). The patient showed local metastases, and was progressing favourably. Blood No. 1 was from a case of normal breech delivery of a primipara admitted as coronary heart disease, and which had just been reached. It was found that which had been previously diagnosed was taken before the case was re-examined. Death to the cardiac on the former case-sheet being provisional. After the blood had been dispatched it was found that pulmonary the patient had developed, in addition to symptoms, marked dullness over the left region. The removal of a large quantity of fluid did not restore the resonance, and a radiogram was taken. The result, which came in after the result of the Bendien test, indicated neoplasm of the lung. Specimens 3 and 4 were from cases of gastric ulcer.

	Neo-natal	Per cent.	Prim.
3.4	12.5	above	

If further results prove as consistent as the first batch, the case for the Bendien test will be greatly strengthened. The fact that a positive result is obtained in three different conditions—namely, carcinoma, tuberculosis, and gall-stones with jaundice—does not very greatly detract from the value of the test, for it must seldom constitute a difficult problem for the clinician to distinguish between these conditions.

One difficulty in the test is the large amount of blood required; in the complete test with twenty tubes, 10 c.cm. of serum are used. Although this difficulty is not insuperable, it must be an advantage to use a technique in which the test may be performed with smaller amounts of material. This I am attempting to do by cutting down all the quantities used in the test to one-fifth: thus 0.1 c.cm. of serum is mixed with 0.1 c.cm. of distilled water (or better still, 0.2 c.cm. of a 50 per cent. solution of serum is taken), and 1 c.cm. of the acetic acid-sodium vanadate mixture is added. A 5 by 1 cm. tube is convenient for this technique. Very thorough shaking is required, I find, in order to obtain the same results as with the larger quantities. I also omit tubes 11 to 20, since they are irrelevant to the diagnosis, and in this way the test may be very compactly performed with 1 c.cm. of serum.

I have pleasure in acknowledging facilities granted by Dr. Menton, county bacteriologist, Stafford, to carry out these tests, and for permission to publish the above results.—I am, etc.,

County Laboratory, Stafford, Sept. 7th. J. FINE, B.Sc., M.B., Ch.B., D.P.H.

Obituary

LOUIS SAMBON, M.D.

Formerly Lecturer, London School of Tropical Medicine

Dr. LOUIS SAMBON, well known for his work on tropical disease and his theories on the etiology of cancer, died suddenly in Paris on August 30th, at the age of 65. He was a member of the Société de Médecine Tropicale of Paris, a Fellow of the Royal Society of Tropical Medicine and Hygiene, and an honorary Fellow of the Manila Medical Society. His published writings included an account of the cholera epidemic of 1884, a paper on prevention of infectious diseases, read before the seventh International Congress of Hygiene and Demography, held in London in 1891, communications on sleeping sickness and blackwater fever, and various articles describing in much detail his inquiries in Italy and elsewhere, which led him to believe in the existence of "cancer houses" and "cancer streets." At the Annual Meeting of the British Medical Association held at Sheffield in 1908, Dr. Sambon was a vice-president of the Section of Tropical Diseases.

We have received the following appreciation from Dr. GERALD HOLROYDE, who worked in close association with Dr. Sambon during recent years:

By the death of Louis Westenra Sambon the world of medicine has lost one of its brightest ornaments. Born in England of Anglo-French parentage, his mother being an Englishwoman and his father a Frenchman, he received his medical training at St. Bartholomew's Hospital and the University of Naples, graduating M.D. in 1891. While still a student at Naples he worked all through the terrible cholera epidemic. For his work in this connexion he was decorated by both the Italian and French Governments.

He started his professional career as a gynaecologist in Rome, but the lure of England was too strong for him, and he came to London, against the strongly expressed wishes of his father. Here he met Sir Patrick Manson, and a close friendship sprang up between them, which persisted up to Manson's death. He nearly ruined his career

at its very onset by publishing, in the *British Medical Journal*, an article on "Acclimatization," in which, contrary to universal opinion at that time, he held and proved that it was the parasite and not the climate which killed the white man in tropical lands. Though universally ridiculed at the time, Sambon, sixteen years later, in Panama, had the satisfaction he so well deserved. Invited to see what the Americans had done for the sanitation of the canal zone, General Gorgas, before the assembled physicians and surgeons, turned to him and said, "My colleagues and I are pleased to have been able to prove that you were right." To detail his many triumphs in the field of tropical medicine would occupy more time and space than is possible, but perhaps this tribute to his ingenuity may be permissible. In 1902 Sir Patrick Manson, at that time medical adviser to the Colonial Office, sent for Sambon, and asked him if he would go to Uganda to study sleeping sickness. Here was an opportunity after Sambon's own heart, but, unfortunately, for family reasons, he had to refuse. Unable to go himself, he urged the claims of a friend then studying at the London School of Tropical Medicine (Castellani). Sore at heart, he returned to his study, determined to do his best to unravel the mystery of the African sleeping sickness. He gathered all available literature on the disease, and soon obtained some inkling of its topographical distribution and epidemiology. He felt sure the peculiar patchy riverside distribution of sleeping sickness, which he had been able to glean from the literature, would soon reveal its causation. Indeed, when Castellani, working in Uganda, found first a streptococcus, then a trypanosome in the cerebro-spinal fluid of sleeping sickness patients, Sambon strongly supported, against Manson himself, the etiological importance of the trypanosome, and pointed out that the infection was transmitted by the dusky tsetse fly.

A man of many parts, an acknowledged authority on parasitology throughout the world, it is as an epidemiologist that Sambon will be chiefly remembered. Few men possess the breadth of vision, combined with the knowledge of so many interallied subjects, necessary for the production of the successful epidemiologist. No man can earn a livelihood by it, and no man has even attempted to do what Sambon did. He devoted his life to the subject. His last years were given to the study of cancer. Whilst travelling on the Continent in this connexion, on Christmas Day, 1929, lunching at a café in the shadow of St. Peter's wonderful cupola, he suddenly turned to me and said, "I shall hate to die." Asked his reason, he said, "Because there is so much to do, and so little time in which to do it." Prophetic words indeed! With his passing, much that would have benefited the human race is lost. In common with many people, in several lands, I mourn the loss of a warm-hearted, courteous friend and colleague.

Dr. WYKEHAM TRACY LYDALL, who died on August 20th, was born in 1871. Receiving his medical education at Bristol, he obtained the diplomas M.R.C.S., L.R.C.P. in 1895, and graduated M.D.Brux. two years later. He commenced practice in Birmingham in 1897, and associated himself actively with the British Medical Association, being one of the honorary local secretaries at the Annual Meeting in Birmingham in 1911. Dr. Lydall held the posts of secretary and chairman of the Birmingham Division, and served for a long time on the Birmingham Panel Committee and many of its subcommittees. He was editor for several years of the *Midland Medical Journal*. During the war he held a temporary commission in the Royal Warwickshire Regiment. He was medical officer to the Royal Air Force squadron at Castle Bromwich, and for some years acted as assistant regional officer to the Ministry of Health. He was a member of the council of the Medical Defence Union. Dr. Lydall is survived by a widow, a daughter, and three sons.

Lieut.-Colonel ANDREW ALEXANDER WATSON, C.M.G., D.S.O., R.A.M.C.(S.R.) (ret.), of Gaerstones, Church Stretton, Shropshire, died in a nursing home at Shrewsbury on August 31st, at the age of 75. He was educated at the University and Royal College of Surgeons, Edinburgh, and took the L.R.C.P. and S.Ed. in 1880. He served in the R.A.M.C. Special Reserve throughout the South African war, taking part in operations in the Orange Free State, was mentioned in dispatches in the *London Gazette* of April 16th, 1901, and gained the King's and Queen's medals, with two clasps each. During the war of 1914-18 he was mentioned in dispatches in the *London Gazette* of February 17th, 1915, January 1st, 1916, and January 4th, 1917, and received the D.S.O. in 1917 and the C.M.G. in 1919. He retired in 1922. He had been surgeon, and later honorary consulting surgeon, to the Victoria Hospital at Burnley.

The following well-known foreign medical men have recently died: Dr. OSKAR MINKOWSKI, formerly professor of internal medicine at Breslau, who discovered the internal secretion of the pancreas, at Wiesbaden, aged 73; Dr. GASTON BOSC, senior physician to the hospital at Tours; and Dr. FERDINAND CHAILAN, a Marseilles ophthalmologist.

Medical Notes in Parliament

[FROM OUR PARLIAMENTARY CORRESPONDENT]

Parliament reassembled on September 8th for a short emergency session, which may be followed by an autumn General Election. There was a full attendance of members, including Dr. Salter and Mr. Somerville Hastings, chairman and honorary secretary of the Parliamentary Medical Committee, who had just returned from a tour in Russia. During the week the Economy Bill and a Supplementary Budget were introduced by the Government in the House of Commons.

On September 8th the PRIME MINISTER moved that the House should resolve itself into a Committee of Ways and Means for raising supply. He appealed to all classes and conditions to go cheerfully over the broken road, along which our security, honour, and well-being would be found. The burdens they would be asked to bear would be, in relation to the national services required, not inadequate nor inequitable. This was not a selfish attack on incomes, a pernicious cutting down of expenditure, an inroad on standards of living; it was a ranging of all in a common contribution to uphold the credit of the nation, on which the life and income of every citizen depended. The Prime Minister made no specific reference to any social service.

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

Dr. Eric G. Holmes, Christ's College, has been appointed University Lecturer in Pharmacology for three years from October 1st next; and Dr. Frank Robert Winton, Clare College, has been appointed University Lecturer in Physiology for three years from the same date.

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH

Honorary Fellowship

On the occasion of the 250th anniversary of the Royal College of Physicians of Edinburgh it has been decided to confer the Honorary Fellowship of the College on Sir David Bruce, K.C.B., Lord Dawson of Penn, G.C.V.O., Sir Archibald Edward Garrod, K.C.M.G., Sir William Hale-White K.B.E., Sir Robert Hutchison, M.D., Sir Thomas Lewis, C.B.E., Sir Donald MacAlister of Tarbert, Bt., K.C.B., Sir Edward Sharpey-Schafer, Sir Charles Scott Sherrington, O.M., Charles Achard (Paris), Frederick Grant Banting, M.C. (Toronto), A. A. Hijmans van den Bergh (Utrecht), Knud Faber (Copenhagen), George Richards Minot (Boston), Friedrich von Müller (Munich), Hermann Sahli (Bern), William Sydney Thayer (Baltimore), and Julius Wagner-Jauregg (Vienna).

Medical News

The British Science Guild announces that Dr. H. H. Dale, F.R.S., will give the Norman Lockyer Lecture at the Goldsmiths' Hall, E.C., on Tuesday, November 24th, at 4.30 p.m.

The opening of the winter session at King's College Hospital will take place in the Medical School, Denmark Hill, S.E.5, on October 1st, at 2.15 p.m. The introductory address will be given by Professor H. R. Dean, professor of pathology in the University of Cambridge, and Mr. A. D. Power, vice-chairman of the committee of management of King's College Hospital, will preside. The annual dinner of past and present students will be held the same evening, at 7.30, at the Connaught Rooms, Mr. L. Vernon Cargill presiding.

The annual congress of the Chartered Society of Massage and Medical Gymnastics will be held in London from September 29th to October 3rd. The annual dinner will be held at the Connaught Rooms, on October 2nd, at 7.30 p.m. Reduced railway rates are available.

The Fellowship of Medicine and Post-Graduate Medical Association announces the following courses: medicine, surgery, and specialties at the Metropolitan Hospital, Kingsland Road, E., from September 28th to October 10th, occupying the whole of each day; fee £3 3s. or £2 2s. for one week only. A similar course at the Prince of Wales's Hospital, Tottenham, from October 12th to 24th; fee £5 5s. or £3 3s. for one week. A course of lectures for the M.R.C.P. in the evenings, at 8.30, at the Medical Society of London, 11, Chandos Street, Cavendish Square, on Mondays and Wednesdays, beginning October 5th; fee £6 6s. for eighteen lectures, or 10s. 6d. per lecture, payable at the lecture room. Diseases of the throat, nose, and ear at the Central London Throat, Nose and Ear Hospital, Gray's Inn Road, occupying the whole of each day, from October 5th to October 31st, and including a clinical course, fee £5 5s.; a pathology class, fee £5 5s. (limited); a peroral endoscopy class, fee £6 6d. (limited); and an operative class, fee £7 7s. (limited). Tropical medicine at the Hospital for Tropical Diseases, 25, Gordon Street, from October 5th to 24th, occupying the whole of each day: fee £8 8s. Copies of syllabuses of all courses may be obtained from the Fellowship of Medicine, 1, Wimpole Street, W.1, also syllabuses of the series of free lectures and demonstrations for October, November, and December.

A new series of post-graduate lectures at King's College Hospital Medical School, Denmark Hill, S.E.5, will commence on Thursday, October 8th, at 9 p.m., when Sir StClair Thomson will speak on cancer of the larynx. The lectures will be continued on succeeding Thursdays till March 17th, 1932, with the exception of December 24th and 31st.

A post-graduate course, free to all medical practitioners, will be held at St. Mary's Hospital Medical School from Friday, October 2nd, to Sunday, October 4th, inclusive. It will occupy the mornings and afternoons of the first two days, and the morning only of the third day. The subjects to be dealt with include the treatment of some common fractures, rheumatoid arthritis, chronic indigestion, slow labour, colitis, and chronic cough, diseases of the tongue, prenatal care, surgical operations in old people, the pregnancy toxaemias, disabilities of the foot, new methods of genito-urinary surgery, and fever without signs.

A three months' course of lectures and demonstrations on clinical practice and in hospital administration for the diploma in public health will be given by the medical superintendent, Dr. A. Joe, at the North-Western Hospital, Hampstead, on Mondays and Wednesdays at 3.30 p.m., and on alternate Saturdays at 11 a.m., commencing on Wednesday, September 30th. The course complies with the requirements of the revised regulations of the General Medical Council, which come into operation on October 1st, 1931; fee £3 13s. 6d.

On September 22nd an exhibition representing the publications and history of the Cambridge University Press will be opened by General Smuts in the Old Court House at Messrs. J. and E. Bumpus's bookshop in Oxford Street, W. The publications to be found in the current Cambridge catalogue, some 4,000 volumes, will form the main part of the exhibition, but there will be a historical exhibit illustrating the history of the University Press and the development of printing craftsmanship at Cambridge since 1521. This exhibit will comprise documents from the archives of the Press and a collection of old books covering the four centuries of Cambridge printing; it will include works by Erasmus, James I, Milton, George Herbert, Donne, Fuller, William Harvey, and Sir Thomas Browne, and more recent famous books, all of which were first printed at Cambridge. The exhibition will coincide with the Centenary Meeting of the British Association, and the range of scientific works in the catalogue makes it suitable that the president of the meeting, who is himself a Cambridge man, should perform the opening ceremony.

The Minister of Health, the Right Hon. Neville Chamberlain, M.P., has appointed Mr. A. Nevil Rucker to be his private secretary, and Mr. W. H. Howes to be his assistant private secretary.

The third International Congress of Psychotherapy, Hypnology, and Applied Psychology will be held in Paris from September 28th to October 4th, under the presidency of Dr. Berillon. Further information can be obtained from the general secretary, Dr. Pierre Vachet, 8, Boulevard de Courcelles, Paris, XVIIe.

The fourteenth Italian Paediatric Congress will be held at Florence from September 23rd to 26th, when the following subjects will be discussed: (1) purulent pleurisy in infancy, introduced by C. Cocchi of Florence, A. Laurinich of Naples, and I. Nasso and E. M. Castronuovo of Messina; (2) encephalitis in childhood, introduced by M. Bergamini of Parma, G. De Toni of Bologna, and G. Tacone of Milan; (3) directions for diet in communities of children, introduced by P. Brusa of Milan, A. Lucca of Turin, and G. Macciota of Cagliari.

We are informed that the Second International Congress for Light, which was erroneously reported in our issue of August 22nd to have been held this year, will take place in Copenhagen from August 15th to 18th, 1932. The following are the subjects for discussion. (1) The role of pigment in light biology and the therapeutic effect of general light baths. Principal speakers: Dr. Brody (France), Professor Miescher (Switzerland). (2) How is the action of the general light bath in tuberculosis to be explained? Principal speakers: Sir Henry Gauvain (England), Professor Jesionek (Germany). (3) Heliotherapy, climatological research in relation to public health: its organization and physiological basis. Principal speakers: Professor W. Hausmann (Austria), Professor A. Rollier (Switzerland). (4) Report by the international committee for the determination of a standard unit of measurement for ultra-violet radiation. Read by Dr. Saidman (France). Further information can be obtained from the general secretary, Dr. Kissmeyer, Finsens Lysinstitut, Strandboulevarden, Copenhagen.

The National Birth Control Council and the Birth Control Investigation Committee have amalgamated under the title of the National Birth Control Association. Since it was set up last year the council has been engaged mainly on work with local authorities in regard to the Ministry of Health's memorandum on birth control. So far thirty-five local authorities have authorized the giving of advice on contraceptive methods. Sir Thomas Horder is president of the association, and Sir Humphry Rolleston, vice-chairman. Inquiries should be addressed to the secretary, 26, Eccleston Street, S.W.1.

The Neech Prize of the Society of Medical Officers of Health for the best paper read at a meeting of the Society during the session 1929–30 has been awarded to Dr. G. C. M. M'Gonigle of Stockton-on-Tees, for his address on the biological concept of preventive medicine, delivered before the Northern Branch and published in *Public Health*, May, 1930.

Under the auspices of the French Government a group of American doctors recently visited the principal thermal and climatic resorts of France The delegation included Dr Charles Gordon Heyd and Dr Max Einhorn, emeritus professor and consulting physician at the New York Post-Graduate Medical School The last days of the tour were devoted to the watering place of Vichy, where the visitors inspected the springs, thermal establishments, hydrological laboratories, and the bottling and dispatch departments Dr Durand Fardel, president of the Vichy Society of Medical Science, Professor Einhorn, and Dr Gustave Monod, F R C P Lond , a former president of the International Society of Medical Hydrology, gave lectures Distinguished French medical men who attended the farewell banquet included Professor Leon Bernard, Professor Labbé, and Professor Achard, all of the Faculty of Medicine of Paris

At a conference in July of the Association of Special Libraries and Information Bureaux the question of abstracting foreign publications was considered carefully in an informal discussion A conclusion reached was that the abstract of a book should not be written by the author, but by a specialist in the same subject Reports were given by various scientific societies and institutions on the way in which they obtained such abstracts, and a considerable variety of method was revealed It was suggested that the service of the panel of expert translators belonging to the Association of Special Libraries and Information Bureaux might be extended to form a panel of foreign abstractors A small subcommittee was appointed to draft a questionary to be sent to the bodies represented at the meeting (and other similar organizations) about the methods of abstracting which they had found to be most satisfactory

A table has been issued by the Ministry of Health, based on the returns made by the Poor Law authorities in England and Wales, comparing the average number of persons receiving poor relief in June, 1931, with the number recorded in June, 1914 In June, 1931, the average number (including men, women, and children under 16 years) in receipt of outdoor relief, mainly on account of unemployment, was 152 500, while those to whom relief was granted for some other cause numbered 627,400 This classification is not available for 1914, but the number receiving unemployment relief at that time is stated to have been almost negligible In June, 1931, the total number in all classes was 779,900, compared with 372,600 in 1914—an increase of 407,300 It is added that the number recorded in June of this year was less by 3,800 than that recorded in the previous month The figures given above do not include 13,200 persons in receipt of medical relief only in their own homes In 1914 the average amount of outdoor relief, estimated per person, was 2s 6d , compared with 5s 8d in June, 1931 (approximately 3s 11d , allowing for the increased cost of living) Persons receiving institutional relief—other than rate aided patients in mental hospitals and casuals—numbered 246,200 on a day in June, 1914, compared with 195,600 on a corresponding day in June, 1931 This number is stated to be 2,700 less than the total number recorded in May, 1931

Professor Carl Neuberg, director of the Kaiser Wilhelm Institute for Biochemistry, who recently lectured in Paris before the Société Chimique de France and Société de Chimie Biologique, has been awarded the Pasteur and Leblanc medals, as well as the Pasteur Commemoration plaquette

Owing to the present unfavourable economic conditions the Congress for Diseases of Digestion and Metabolism, which was to have been held this year in Vienna, under the presidency of Professor Falta, has been postponed till next year

Messrs Cassell and Co , Ltd announce for immediate publication *Modern Medical Treatment*, by Drs E Bellingham Smith and Anthony Feiling, in two volumes, and *Radiology in Relation to Medical Jurisprudence*, by Dr S Gilbert Scott

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to **The EDITOR, British Medical Journal, British Medical Association House, Tavistock Square, W C 1.**

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated Correspondents who wish reply to be taken of their communications should authenticate them with their name not necessarily for publication

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager British Medical Association House Tavistock Square W C 1 on receipt of proofs

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Publishers Manager

The **TELEPHONE NUMBERS** of the British Medical Association and the *British Medical Journal* are MUSEUM 9861 (6862 6863, and 9864 (internal exchange four lines)

The **TELEGRAPHIC ADDRESSES** are

EDITOR OF THE *BRITISH MEDICAL JOURNAL* Articulate Westcent London

FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisement etc) *Articulate* Westcent London

MEDICAL SECRETARY, *Mediocra* Westcent London

The address of the Irish Office of the British Medical Association is 16 South Frederick Street Dublin (telegrams *British Dublin* telephone 62990 Dublin) and of the Scottish Office 7 Drumsheugh Gardens Edinburgh (telegrams *Associate Edinburgh* telephone 24361 Edinburgh)

QUERIES AND ANSWERS

Disturbed Sleep

"C M" writes A young woman aged 21 has suffered for some months from weeping and moaning in her sleep sufficiently severe to waken her No cause can be discovered for this distressing symptom and the usual hypnotics have failed to give relief Can any reader suggest a remedy?

Tobacco and Irritable Heart

Dr W M M JACKSON (Folkestone) writes I should be glad to know if there is any tobacco suitable for a patient with irritable heart who is unable to smoke ordinary tobacco however mild without symptoms of cardiac distress

Treatment of Threadworms

In reply to the inquiry by F (August 29th p 407) two correspondents have written to recommend bismuth carbonate one advising 10 to 40 grain doses for a child under the age of 7 at four hourly intervals and 20 grain doses for an adult The other suggests that for a child aged 8 the administration of 10 to 15 grains four times daily would be sufficient in addition to the necessary local treatment and disinfection of the clothing and finger nails Garden soil is said to be often infested with these worms

Dr G W WILLCOX (Crowborough) records a case in a child of about the same age in which saline enemas continued for a long period, cleared up the condition temporarily recurrence following when the treatment ceased Removal of an appendix packed with worms resulted in a cure

Dr H T MACAULAY (Peterborough) suggests the trial of batolan (Bayer Products Ltd) in half tablet doses three times a day On alternate nights hydrocumcret should be administered, followed by milk or cream of magnesia the next morning Quassia enemas and other forms of treatment should be given simultaneously

"E G" who advises removal of the appendix writes Recently a patient of mine was operated on for chronic appendicitis In addition to its obvious pathological defects there was a pocket at the distal end of the appendix which was a nest of threadworms Whether or not that was the original focus at any rate the place was inaccessible to ordinary methods of treatment In such a severe and persistent case as F describes the more serious operation I have suggested might be justified

Another correspondent recommends that he [illegible] three or four ginger biscuits after each meal [illegible] ginger keeps the duodenum and small intestines and the rectum free from *E vermicul* even in adults Ginger cakes and puddings are palatable methods to enable the ginger to reach the site of the trouble

Treatment of Brittle Nails

Dr. A. J. TURNER (Lee-on-the-Solent) writes: In reply to the inquiry by "J. W." (August 22nd, p. 367), I had a case of mother and child, both of whom had nails like paper. The mother informed me that for many years she had not been unable to untie a knot. Both patients were under treatment for the rheumatic diathesis, and were having sodium salicylate. When I heard about the nails, I added daily doses of 1/10 grain of thyroid extract for the mother, and proportionately smaller doses for the child. The nails became of normal strength and consistency in the course of about three months. It was difficult to say whether the cure was due to the salicylate or to the thyroid extract, or to both. Possibly the same treatment would apply to a condition of brittleness of the nails alone.

Harvest Mites

A correspondent writes: If "Sufferer" has been disappointed in the classical cure recommended, let him try the Marcussen formula for the Danish treatment of scabies. He may find his dispenser shy about compounding, but this ointment has recently appeared in England under various registered names. One dab of the ointment kills the parasite, and, if rubbing is avoided, irritation soon subsides; if irritation returns the treatment should be repeated. "Sufferer" still awaits a suggestion for removing this terror from the garden, and may obtain substantial satisfaction from the following. Let his gardeners kill every "red spider" seen throughout the year. The bright colouring makes it an easy prey, especially when it is pregnant in spring and early summer. Let "sticky bands" be kept around the trunks of his fruit trees from May till October. With or without a lens the observed results should be encouraging.

The Plural of Os Calcis

Dr N. PINES (London, E.) writes. Dr. Anderson is right; the plural for os is ossa, and the plural for os calcis may be ossa calcis or ossa calcium.

"A. C. B." writes: I put Dr. Kenneth Anderson's query to a classical scholar, and the answer was ossa calcis.

Colonial Medical Services

"E. G." (Wales).—Information about the Colonial Medical Services appeared at page 472 of the Educational Number of the *British Medical Journal*, published on September 5th.

Income Tax

Change in Partnership Share

"T. C." has been in partnership with A, on the basis of two-thirds and one-third. As from January 1st, 1932, that basis will be changed to equal shares. How should the assessment for 1931-32 be divided between the partners?

*** "T. C." had two-thirds for three-quarters of the year, and half for the remaining quarter—that is, over the whole year he had (2 3 × 3 4 + 1 2 × 1 4 =) 5/8, and A had the remaining three-eighths, of the year's earnings. The gross assessment, therefore, should be divided on that basis, and the personal allowances adjusted as may be necessary.

Allowance for Bad Debts

"I. I. C." makes his accounts up as for the year ending September 30th, but usually is unable to find the necessary time until, say, the following May. His practice is still increasing, and he cannot therefore claim to be assessed on the basis of cash receipts. In the past he has regarded as "bad" all debts due as at the previous September which were unpaid when he has made up the year's account. It is objected that this is too drastic an allowance (though, of course, debts so regarded as bad but subsequently paid have been returned for assessment), and that debts should not be regarded as bad until they had remained unpaid for, say, two years.

*** The legal position is that each debt should be separately reviewed and an estimate made of the probable amount recoverable, and the difference regarded as "bad or doubtful." This, of course, is a cumbrous method of calculation, and even when considerable trouble is taken the result may prove to be wide of the facts. Consequently, where it is adopted for the sake of the convenience of the taxpayer the revenue authorities are not unreasonably entitled to be to some extent on the safe side. Perhaps some rule-of-thumb method has much to commend it, but "I. I. C." could arrange some half-way compromise—for example, to regard as bad all debts due up to September 30th not paid by the following Christmas twelve-months.

LETTERS, NOTES, ETC.

Prophylaxis of the Common Cold

Dr. ELIZABETH MCKERROW (Workington) writes: At the onset of another winter—and particularly after such a poor summer—I should like to suggest through your columns a simple method of attempting to reduce the amount of illness that sweeps the country every year, directly and indirectly, through the common cold. My suggestion is merely that of every operating theatre—namely, the wearing of a gauze veil in every case of cold. If each unfortunate patient could be persuaded to use this method of protecting others from infection its good effect would soon be apparent. The only objection would be the "oddness" of wearing something so unusual, but that would easily be overcome if it were widely suggested, and adopted, by practitioners. One point in its favour—in popularizing it—would be the possibility of having veils that were becoming to the wearer, after the manner of the Egyptian yashmak, for instance. This would certainly be a vast improvement on the appearance usually presented by the nose and mouth of most victims of the common cold.

Management of Breech Labour

Dr. A. T. ROSS (Mevagissey) writes: With reference to Mr. Aleck Bourne's "Management of breech labour" in the *Journal* of August 29th, to deliver the head I was taught that I must put my fingers in the mouth. After about two attempts—with the feeling that the jaw was going to go—I used forceps, and have never used any other method for some thirty years. Forceps, to apply, are simple; to produce (if necessary) flexion they are mechanically correct; and to achieve the object—delivery—they are excellent.

Motor Car Insurance Policies

Mr. L. FERRIS-SCOTT (Honorary Secretary, Medical Insurance Agency) writes: May I ask you to issue to your readers a warning that they should be careful to see that the insurance policies in connexion with their motor cars are kept in force and are not allowed to lapse by inadvertence owing to the non-payment of premium on the due date? An insurance company doing motor car business was recently fined £50 on a summons under the Road Traffic Act for issuing a certificate of insurance which was false in a material particular. The prosecuting counsel explained that the case was the first of its kind, and it is understood that notice of appeal was given; but, pending the hearing of the appeal, the judgement stands. A motor driver was found to have a certificate of insurance which expired on June 3rd. When spoken to about it by a policeman he went to the office of the insurance company, where he was given a certificate dated back to June 4th. It was held that the certificate should have been dated on the date it was issued, and that the different date constituted a statement which was false in a material particular, and the insurance company was fined accordingly. It will be seen, therefore, that as the law now stands it is dangerous for an insurance company to date back a certificate of insurance under the Road Traffic Act, and in consequence, if the policy is allowed to lapse owing to non-payment of premium, there would be a break in the continuity of the policy, during which period the doctor concerned would be uninsured and liable to all the penalties under the Road Traffic Act attaching to that condition.

Warning

Dr. HELENA P. KELLY (Leytonstone) writes: I should be much obliged if you warned readers of the *British Medical Journal* against giving orders to the man Kelly (August 29th, p. 408) on the plea that he is a friend or relation of mine. He has been to several of my medical friends, and got cash for orders which never materialized, on my supposed recommendation. I know nothing about him beyond the fact that he called on me a few months ago looking for orders for bottles, etc. I ordered bottles, but when he told me that the terms of "his company" were cash with the order, I immediately cancelled my order. Since then I have heard that he also goes under the name of Burke.

Vacancies

Notifications of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals, will be found at pages 42, 43, 44, 45, 46, 47, 50, and 51 of our advertisement columns, and advertisements as to partnerships, assistantships, and locumtenencies at pages 48 and 49.

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page 179.

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

191 Acute Cerebral Rheumatism

E. TOULOUSE, L. MARCHAND, and A. COURTOIS (*Bull. et Mém. Soc. Méd. des Hôp. de Paris*, June 12th, 1931, p. 1119) describe the case of a young woman, aged 20, who contracted acute articular rheumatism on January 1st, 1930, and was admitted into the Tenon Hospital on February 5th, where she was treated with 8 grams of sodium salicylate daily. She was transferred to the Henri-Rousselle Hospital eight days later, since she had developed cerebral symptoms on February 9th. There were at that time no articular symptoms, but mental confusion, motor agitation, and continuous cries were noted. The temperature varied between 100° and 102°. There were no lymphocytes or abnormal albumin in the cerebro-spinal fluid. The Wassermann reactions of the blood and cerebro-spinal fluid were negative. Although 2 grams of salicylate were daily injected intravenously there was no improvement; stupor supervened, and the patient died on February 20th. The brain was found to be congested, and there were some adhesions between the frontal lobes and the inner table. The pia mater was healthy, but the cerebrum showed diffuse cellular lesions with atrophy of the cell body so that the nuclei appeared large. The chromophil bodies were fragmented, and the nuclei eccentric and sometimes extruded. In the subcortical white matter there were small groups of six to ten embryonic round cells, but no involvement of the neuroglia was detected. In the central grey nuclei, the optic thalami, the cerebellum, and the peduncles, there were acute cellular lesions, and in the bulb there was a slight lymphocytic reaction of the pia mater. Well-marked cellular lesions were found also in the nuclei of the cranial nerves.

192 Circulatory Efficiency in Heart Disease

H. W. BANSI and G. GROSCURTH (*Deut. med. Woch.*, July 24th, 1931, p. 1276) have made 250 observations of the minute-volume circulation unit (using Grollman's acetylene method), the oxygen intake and carbon dioxide output, the effect of oxygenation on the pulse rate, and the blood pressure on 90 persons, under varying conditions. They found that in heart disease the minute-volume of the circulation did not rise during muscular exertion so much as in normal persons; in severe cardiac cases the volume per beat remained the same, the only increase in circulation rate being brought about by tachycardia. The circulation is thus insufficient for the needs of the body at the time, and an "oxygen debt" is incurred. The increased minute-volume condition has to be continued after the work is finished, and, instead of falling sharply as in normal persons, its curve after exercise shows only a slow return to normal. An abnormal curve of this type was found, not only in cardiac failure, but also in apparently fully compensated, symptomless cases of valvular disease and in myocarditis. Cases of cardiac neurosis, exophthalmic goitre, and supposed post-infective cardiac weakness, on the other hand, gave normal results.

193 Tremor in Industrial Mercurialism

G. PIERACCINI (*Med. Welt*, June 20th, 1931, p. 878) states that tremor is one of the most important and characteristic signs of mercurial poisoning, although it is not pathognomonic of this industrial disease. It is found in almost all cases, alike in mild or severe attacks, and in acute and chronic cases. In mild and moderate cases small fine tremors are seen in the hands, lips, and outstretched tongue, while in severe cases the tremors are much more pronounced and generalized. The tremor ceases as soon as the patient comes under treatment by rest, good nourishment, and removal of the cause, but it is apt to return or to be aggravated by consumption of a small quantity of alcohol or tobacco. The tremor ceases in sleep, except in severe cases, in which three or four attacks may occur in the course of an hour, and be sometimes so violent as to drive the patient out of bed. Recovery may be regarded as complete when administration of alcohol does not produce any tremor in the hands.

194 Malignant Hypertension in Childhood

Essential hypertension is predominantly a rare disease under the age of 30, but J. CRAIG (*Arch. Dis. in Child.*, June, 1931, p. 157) reports a case of its occurrence in a girl, aged 8, including the post-mortem findings. She had had headaches for many years, and the period of the malignant phase, which lasted for at least one year, was punctuated by attacks of convulsions, cerebral amaurosis, unconsciousness, transient haemiplegia, and paralysis of a cranial nerve. Some renal impairment was present, but only became pronounced at the end of the disease, though blood was passed in the urine from time to time. The blood pressure rose steadily, and was particularly high in at least two of the series of acute exacerbations. The typical picture of hypertensive retinopathy was always present, with macular exudates, neuro-retinitis, sclerosis of the retinal vessels, and haemorrhages; woolly patches were only noticeable at the beginning of the observation. The necropsy revealed the typical arteriolar changes of essential hypertension, and the renal arteriolosclerotic atrophies and necroses of the malignant phase of the disease. There was no history in this case of any family tendency to vascular disease at an early age.

195 Serum Reaction following Desensitization

J. C. S. BATLEY (*Arch. of Ped.*, May, 1931, p. 338) records the case of a boy, aged 10, who developed diphtheria after a prophylactic injection of 1,500 units. Desensitization was effected first with 0.12 c.cm. antitoxin with no reaction, followed in half an hour by 0.25 c.cm., and then 0.5, 1, and 2 c.cm. were given at half-hourly intervals. Two hours after the last injection patches of erythema and urticaria appeared on the skin in several places. Vomiting began, and the boy became progressively worse. He had two loose stools. His face and extremities were cyanosed and his pulse could not be felt. After a subcutaneous injection of 1,300 c.cm. of saline the rectal temperature rose from 101 to 106°. The following day he had a generalized morbilliform rash and slight swelling of the cervical glands, but on the next day the rash disappeared, and the temperature was only 99°. Uninterrupted recovery ensued without any more antitoxin.

196 Syphilitic Cardiac Disease

E. P. CARTER and B. M. BAKER, jun. (*Bull. Johns Hopkins Hosp.*, May, 1931, p. 315), review cardio-vascular syphilis from its historical aspect, and remark that the fuller knowledge of syphilitic aortitis dates back at the most fifty years. They have analysed the admissions to the Johns Hopkins Hospital during twelve years, and find that the incidence of the disease is four times greater among coloured than among white patients. Of all patients proved to be suffering from syphilis rather more than one-fifth had aortic insufficiency or aneurysm. In its evolution cardio-vascular syphilis was regarded as falling essentially into four groups: aortic insufficiency, insufficiency with aneurysm, aneurysm, and syphilitic myocardial disease. A detailed analysis of 100 patients suggested the following points as of most importance in the diagnosis: a relatively abrupt and unexpected onset of circulatory embarrassment; increased retro-manubrial dullness, with alteration in the quality of the second sound; absence of evidence of rheumatic infection; dyspnoea on exertion; paroxysmal dyspnoea, often nocturnal; precordial pain, especially if paroxysmal; and a

positive Wassermann reaction. The special characters of paroxysmal dyspnoea in syphilitic aortitis and the great infrequency of coexisting auricular fibrillation were very noticeable. In their views on treatment the authors conform to the modern view, treating first any failure or anginal condition that is present, and later giving iodides and mercury for at least ten or twelve weeks. The importance of exhibiting small initial doses of the arsenicals is emphasized, and reference is made to the successful results of treatment along these lines reported by Danglade.

197 Herpes Zoster and Encephalitis

ANDRÉ-THOMAS and J. B. BUVAT (*Paris Méd.*, June 27th, 1931, p. 600) who record an illustrative case, state that among the numerous nervous manifestations in patients with herpes zoster hemiplegia is one of the most frequent, especially in cases of ophthalmic zoster. The causal relations between zoster and hemiplegia have not always been firmly established, especially when the hemiplegia does not occur at the same time as the zoster, only appears several weeks after the eruption, and develops in an arterio-sclerotic, atheromatous, or syphilitic subject. The question arises whether the area of softening which gives rise to the hemiplegia differs from those frequently observed in old persons who are not suffering from herpes zoster. The case recorded was that of a woman, aged 58, who had been suffering for several weeks from a complicated psychosis, and suddenly developed fever and thoracic zoster. Coma rapidly ensued, followed by death in eight days. No mention is made of a necropsy, but inoculation of the contents of the herpetic vesicles on to the cornea of a rabbit failed to produce keratitis.

198 Nervous Complications of Acute Leukaemia

M. KIEGER-PARENT (*Thèse de Paris*, 1931, No. 169), who records three illustrative cases in young children, states that three forms of nervous complications may be found in leukaemia—namely, the haemorrhagic, a leukaemic infiltration of the neural axis or cranial nerves, and spinal complications. The haemorrhagic complications are much the more frequent, cerebral haemorrhage occupying the first place among them. Cerebral haemorrhage in most cases occurs in the course of acute leukaemia, and has principally been found in children. It is often the first and only sign of a leukaemia which has hitherto been latent. It may sometimes assume a medico-legal interest, especially in cases of sudden death in children.

Surgery

199 Thyroidectomy with the Radio-knife

A. S. JACKSON (*Annals of Surgery*, June, 1931, p. 1132) discusses the advantages and disadvantages of the radio-knife, which he has employed in 160 operations. It has been tried as a routine in all goitre operations, but it was found that a more satisfactory skin incision and a better scar result from using the scalpel. The radio-knife is so rapid in action that it is apt to penetrate the platysma and to cause bleeding from the anterior jugular veins. It was found that the radio-knife is a time-saving factor in thyroidectomy, that haemostasis is better, and that with a drier surgical field the operation is facilitated, fewer forceps being required. More thyroid tissue can be removed with less danger to the recurrent laryngeal nerves and the parathyroid glands than with the scalpel; the radio-knife is also more successful than the scalpel or cautery in the treatment of malignancy of the thyroid. It is of particular value in resecting the hyperplastic or exophthalmic type of goitre, since with the radio-knife it is possible to hollow out the gland, preserving a very thin lateral, capsular wall and narrow posterior strip protecting the recurrent laryngeal nerves and the parathyroid gland. There are some disadvantages following the use of the radio-knife, the most important being post-operative haemorrhage, of which there were three cases in the series. Occasional skin burns have resulted from coagulation too near the surface of the skin, and these cause slight disfigurement of the scar. The radio-knife has proved unsatisfactory in resecting large multiple cystic degenerating adenomas. Other disadvantages are the tendency of the apparatus to fail to function when needed and the fact that the surgeon is dependent on the co-operation of others in the use of the radio-knife. In spite of these drawbacks Jackson concludes that the radio-knife should be used as a routine, since it permits the surgeon to perform a smooth, speedy, and comparatively dry thyroidectomy, thus increasing the patient's chances of recovery.

200 Crossed Renal Dystopia

M. TRINCAS (*Arch. Ital. di Urol.*, May, 1931, p. 447), who records a case in a woman aged 20, applies the term crossed renal dystopia to the kidney which has crossed the vertebral column and is situated above or below or at the same level as its fellow. The two kidneys sometimes remain separate, but more frequently they unite at their poles or inner margins, forming a unilateral renal symphysis. The anomaly is due to a deviation in the embryonic evolution of the kidney, the nature of which is unknown. The dystopic kidney is an essentially anomalous organ with diminished resistance; it often retains its foetal type, and is sometimes atrophied. The pelvis, calyces, and ureter are often the seat of malformations. The various anatomical changes found in the dystopic kidney explain the frequency of hydronephrosis, pyonephrosis, and calculus formation. As the result of compression or traction the dystopic kidney sometimes gives rise to intermittent pain which is usually situated in the corresponding lumbar region, and radiates to the groin and lower limb. Until recently the diagnosis was extremely difficult, but the intravenous injection of uroselectan now enables pyelograms to be obtained similar to those furnished by retrograde uretero-pyelography without the drawbacks associated with catheterization of the ureters. Treatment consists in division of the two kidneys followed by nephropexy of the dystopic organ, or in cases where this is impossible, as in Trincas's patient, the whole renal mass should be attached to the psoas muscle on the posterior and lateral wall of the abdomen. By this method the pain, which is often the only symptom, is abolished.

201 Results of Treatment of Varicose Veins by Injections

S. HANSEN (*Ugeskrift f. Laeger*, June 11th, 1931, p. 646) reviews the experience of the treatment of varicose veins at the surgical polyclinic of the Rigshospital in Copenhagen and in his private practice during the three-year period beginning April, 1927. Of the total of 589 patients, 175 were not treated by injections for various reasons. Among the remaining 414 there were as many as 332 women. The ages of the patients ranged from 17 to 75 years, the average being 37, and the average duration of the varicose veins before treatment was 10 years; they had begun in many cases in childhood. In ninety-six cases one or more ulcers existed, and in eighty-four cases these ulcers were still open when the injections were started. In most cases the injection consisted of a 20 per cent. solution of sodium salicylate. These injections were sometimes preceded by injections of a 50 per cent. solution of grape sugar, which possesses the advantage of practically never provoking pain or necrosis. The fourteen cases of necrosis following the injections of sodium salicylate could largely be traced to faulty technique, for in the first year this complication occurred in 10 per cent. of the cases, in the second year in 2 per cent., and in the third year in 1 per cent. Phlebitis with a rise of temperature and disturbances necessitating rest in bed occurred in six cases. General disturbances with pain and malaise occurred in three cases, mental disturbances in one, tinnitus and vomiting in two, and menstrual troubles in one; there was no case of embolism, but in four cases there was, at the time of injection, a sense of faintness or even signs of collapse. Altogether there were thirty-eight cases associated with more or less troublesome complications during

the treatment. As to the permanency of the results, they were checked from one to three years later in 107 cases. The author classifies these results in various tables, according as the condition was or was not obscured by complications such as ulcers. He concludes that it is well to induce patients to report periodically after treatment, and to warn them that it may have to be repeated after an interval of months or years.

202 Schuller's Disease

J. FREEMAN-DAHL and R. FORSBERG (*Norsk Mag. f. Laegevid.*, May, 1931, p. 523) record a case of Schüller's disease or xanthomatosis with cranial defects, which was first described by A. Schüller of Vienna in 1915 and subsequently in 1919 by H. A. Christian of Boston, under the name of "defects in membranous bones, exophthalmos and diabetes insipidus," and hence sometimes known as "Christian's syndrome." Of fourteen cases collected by Rowland, six were in girls and eight in boys, aged from 3 to 16 years. The most constant feature is the characteristic defects in the bones of the skull, but sometimes defects are found in other bones, most frequently those of the pelvis, vertebrae, and ribs, and also in the long bones. Diabetes insipidus and exophthalmos are the next most constant symptoms. The exophthalmos, which may be unilateral or bilateral, has been regarded as a mechanical result of defects in the orbit. The course is chronic but progressive. Of Rowland's fourteen patients seven died of their disease. The present case was that of a girl, aged 14, who had injured her left temporal region at the age of 5. Five years later she developed polydipsia and polyuria; she also showed exophthalmos and retardation of growth. *X*-ray examination of the cranium revealed a typical map-like skull. The diagnosis of Schüller's disease was confirmed by the negative Wassermann reaction in the blood and cerebro-spinal fluid, the absence of Bence-Jones bodies in the urine, and, last but not least, the high blood cholesterol which indicated a disturbance of lipoid metabolism. A trial was being made of *x*-ray therapy.

203 Isolated Forward Dislocation of the Fibula

W. SCHWARZHAUPT (*Zentralbl. f. Chir.*, June 20th, 1931, p. 1579), who records an illustrative case, states that dislocation at the tibio-fibular joint unaccompanied by fracture is a very rare event. Hirschberg in 1888 collected nine forward and two backward dislocations, and Rinehart, in 1902, seven forward and five backward ones, while seventeen cases of isolated dislocation of the tibio-fibular joint were recorded by Teichmann in 1926. In most of the cases in which the head of the fibula is dislocated, the upper third of the bone shows an oblique fracture. Schwarzhaupt's patient was a lad, aged 19, who a year previously had developed a haemorrhagic effusion into the left knee-joint while playing football. The accident on this occasion was due to a fall while he was trying to free his left leg from the mud into which it had sunk. There was a well-marked protrusion of the head of the left fibula, which was very tender. The knee-joint was freely movable, and a skiagram showed an isolated forward dislocation of the head of the fibula without fracture. The dislocation was reduced under general anaesthesia. A plaster bandage was applied for a fortnight, and after another fortnight's mechanical treatment the patient was able to resume his work.

204 Treatment of Increased Intracranial Pressure

F. KENNEDY and S. B. WORTIS (*Journ. Amer. Med. Assoc.*, April, 1931, p. 1284) state that for the treatment of increased intracranial pressure to be effective it must be based on an intelligent appreciation and proper application of exact physiological knowledge. In 1927 they conducted extensive experiments in order to record pressure changes inside the skull. Their findings were that pressure is increased during sleep, and by the assumption of the horizontal position, coughing, stool straining, struggling, and ether anaesthesia; it is also raised by injections of morphine, glyceryl trinitrate, and hypotonic solutions. The pressure is reduced by raising the head above the level of the heart, by injecting caffeine sodium benzoate and hypertonic solutions, by the removal of cerebro-spinal fluid by the lumbar route, and by periodically sustained deep breathing. Clinically, the causes of increased intracranial pressure in the order of frequency of occurrence are: skull fracture, brain tumour, meningitis, cerebral haemorrhage and thrombosis, subarachnoid haemorrhage, hydrocephalus due to inflammation around the ventricular foramina, hypertension associated with headache, and acute cerebral oedema. The authors outline their method of procedure in all cases of increased intracranial pressure. A full clinical examination is associated with estimation of the blood pressure, a blood count and biochemical investigation, urine analysis, gastric lavage and analysis, and complete examination of the cerebro-spinal fluid for diagnostic purposes. The treatment given is lumbar puncture; the intravenous injection of 100 c.cm. of a hypertonic 50 per cent. solution of dextrose three times daily; the hypodermic injection of 7½ grains of caffeine sodium benzoate every four hours; the introduction at four-hourly intervals into the rectum of 120 c.cm. of a 25 per cent. solution of dextrose; and the elevation of the head of the bed by 15 to 45 degrees. If these measures prove inadequate a skull trephine is performed for ventricular puncture in the posterior fossa. In comatose patients with marked papilloedema who do not react to such procedures within two to three hours, a right subtemporal decompression is undertaken. In suitable cases anti-meningococcal serum is effective.

Therapeutics

205 The Effect of Saponin in Spinach

The dietetic and medicinal properties of spinach have been long known; experiments have shown that when two or three teaspoonfuls of it are given to an infant a rapid increase in weight often follows. In 1914 the presence of saponin in spinach leaves was discovered; spinach has, consequently, a definite haemolytic action in blood gelatin, and it has been suggested that this constituent of spinach might be deleterious. L. KOFLER (*Wien. klin. Woch.*, June 26th, 1931, p. 852) has found that other vegetables such as beetroot and potatoes contain a larger quantity of saponin than is present in spinach. The haemolytic action depends on the *p*H concentration in the vegetable juices, and this compound is decomposed by the hydrochloric acid of the gastric juice. Kofler concludes that the presence in spinach of chlorophyll, mineral salts (especially those of iron), secretin, and vitamins explains the food value of this vegetable. Saponin stimulates the digestion and promotes peristalsis and absorption.

206 Treatment of Dementia Paralytica by Diathermy

C. A. NEYMANN and M. T. KOENIG (*Journ. Amer. Med. Assoc.*, May 30th, 1931, p. 1858) report a comparative study of the therapeutic results in dementia paralytica following the employment of diathermy, and the induction of malaria and rat-bite fever (sodoku). They find that the remission and improvement rates were definitely more favourable when diathermy was used. The death rate was 18 per cent. for malaria, 10 per cent. for sodoku, and 0 for diathermy. The remissions in the case of sodoku persisted only for one or two months; in malaria for three years. They occurred in 8 per cent. of cases in the first form of treatment, and in 22 per cent. in the second. Diathermy resulted in 24 per cent. remissions, many patients showing signs of improvement shortly after the treatment had been instituted; the authors believe that still more satisfactory results will be obtained by more intensive and prolonged applications. Diathermy, moreover, can be tried in cases where the induction of hyperpyrexia by inoculation is contraindicated, and can be employed by any physician who has mastered the simple technique. In many cases ambulant patients can be thus dealt with, for complications are infrequent; the height of the consequent pyrexia can be regulated with absolute

precision, in sharp contrast with the less controllable sequels of inoculation therapy. The authors add that it is more difficult to arrest the course of rat-bite fever than is always realized ; one single injection of neoarsphenamine is often inadequate, and five or six injections may be required. They have used diathermy without untoward effects in patients suffering from arterio-sclerosis, diabetes, and advanced organic cardiac disease.

207 Serotherapy in Scarlet Fever

A. STEWART (*Minnesota Med.*, June, 1931, p. 537) restricts the use of scarlet fever antitoxin to septic or toxic cases ; all the patients in his series recovered who were so treated before the fourth day of the disease. In 7.5 per cent. adenitis and otitis media developed, and 23 per cent. of the patients had serum sickness, a few reactions being moderately severe, though most were mild. Stewart commends scarlet fever antitoxin as a specific and prompt cure for this infection, if given early, and particularly valuable in septic and toxic cases. He advises against its prophylactic employment, however, because some patients do not become immunized, and others lose such induced immunity very quickly. Moreover, in many instances the reactions are very severe, and Stewart has had one fatal case. He finds the Schultz-Charlton blanching test helpful in distinguishing scarlet fever from erythemas and drug rashes, but of little use in the diagnosis of mild cases where the rash is only slight.

208 A. LICHTENSTEIN (*Acta Paediatrica*, June 30th, 1931, p. 549) records his observations on 512 cases of moderate and severe scarlet fever treated with scarlet fever streptococcus antitoxin at the Stockholm Epidemic Hospital between 1926 and 1929, during which period the total number of cases of scarlet fever under treatment at the hospital was 2,104. The dose was 10 c.cm., and in exceptional cases 20 c.cm., injected intravenously. In uncomplicated cases the serum obviously had a rapid and favourable effect. If given within the first three days of the disease it appeared to reduce the frequency of subsequent complications as compared with cases which did not receive the serum until the fourth to seventh days of disease, or did not have any serum treatment at all. None of the cases proved fatal in which serum had been given before the appearance of any complications. Apart from slight collapse in a few cases, and one instance of serum disease, this treatment had no bad effects.

209 Liver Therapy in Anaemia

R. T. BEEBE and G. E. LEWIS (*Amer. Journ. Med. Sci.*, June, 1931, p. 796) find that the maintenance dose of liver, or a potent substitute, in cases of pernicious anaemia varies with different patients. They were able to classify 108 patients into four groups: (1) 64 in whom the red cell count remained at the normal level, with relatively small amounts of effective substance ; (2) 31 who needed large amounts ; (3) 5 in whom the count remained 20 per cent. below normal with large doses of liver and iron ; (4) 8 patients whose red cells and haemoglobin remained below normal with large amounts of liver, but maintained normal level when iron was given. They confirm previous observations regarding the inhibitory effect on liver treatment caused by infection, and suggest the special effect of arterio-sclerosis in conditioning the response to liver therapy, a larger maintenance dose being needed when arterio-sclerosis is present ; it was noted that neuromuscular symptoms decreased less in these cases. The authors conclude that the maintenance dose is " not some liver, but enough liver for the given case."

210 F. AMANTEA (*Il Policlinico*, Sez. Prat., June 22nd, 1931, p. 873), by giving doses of liver extract subcutaneously to dogs rendered anaemic by bleeding, and to human subjects suffering from various types of secondary anaemia, has obtained satisfactory evidence that these anaemias may be successfully treated by hepatotherapy. Out of 11 human subjects one only failed to show improvement ; 2 c.mm. of extract were given daily over periods of three to four weeks. The author considers that the lack of success reported by other observers may be accounted for by the administration of too small doses, by the presence of infection or other complication, or by not commencing the treatment soon enough. He is opposed to the use of fresh liver in any form, believing it is usually distasteful to the patient, disturbing to the appetite, and in consequence not taken regularly.

211 Alepol in Leprosy

B. D. DIKSHIT and T. M. ROW (*Indian Med. Gaz.*, June, 1931, p. 317) describe the action in leprosy of a sodium salt of the fatty acids of hydnocarpus oil termed alepol. Of fairly low toxicity, it is rapidly absorbed when given hypodermically or intramuscularly. Intramuscular injections of 3 per cent. strength are well tolerated and cause no marked irritation. Alepol irritates mucous membranes and, owing to this action on the gastric mucous membrane, it causes vomiting when administered orally. It possesses marked haemolytic properties ; when given intravenously it causes a fall in blood pressure due to its action on the heart. It has no special action on other systems of the body. The effects of the drug in eight cases are briefly summarized ; apparently improvement occurs only in cases with lesions falling into the group A1.

Neurology and Psychology

212 The Vibration Sense in Post-encephalitic Parkinsonism

C. WORSTER-DROUGHT and T. R. HILL (*Journ. Neurol. and Psychopathol.*, April, 1931, p. 318) record twenty-five cases of generalized post-encephalitic Parkinsonism, all of which were found to exhibit definite impairment of the vibration sense, and deep-pressure pain. The test employed was measurement of the vibrations by a tuning-fork, the base of which was placed firmly upon a bony surface or prominence. Clinically there is an extremely close correlation between this sense and the ability to recognize passive movements; when one is lost or impaired, the other is affected proportionately. The curves obtained by plotting the time readings for various bony projections, in both normal and Parkinsonian patients, were found to be parallel, but in Parkinsonism the curve obtained differs in showing a diminution in the period of perception of the stimulus amounting to five to twelve seconds. The more severe the syndrome, the greater was the reduction in the period of perception, this period being at its shortest in cases with marked bradyphrenia. Cases of Parkinsonism in which one side of the body was more involved than the other yielded lower readings on the more affected side. The authors discuss the explanation of the slight diminution of vibration sense, and of appreciation of the deep-pressure pain, and suggest the presence of some degree of depression of the essential thalamic function consequent on the encephalitic infection.

213 Integration of Sensory Processes

R. S. CREED (*Brain*, April, 1931, p. 29) reviews critically the various opinions held about the physiological integration of sensory processes within the grey matter of the nervous system. He agrees that the afferent pathway from a receptor organ to the higher levels of the brain can no longer be visualized as a telegraph line, being more similar to a complicated telephone exchange. Impulses travelling along peripheral nerve fibres influence, and are influenced by, stimuli from end-organs of similar and of diverse function, being at different times inhibited or reinforced. Special attention is devoted to the case of the eye, and the way in which physical integration of the processes originated in the retina is brought about. The classification employed by the author is based on the character of the interaction which is manifested, the types being: (1) temporal summation ; (2) spatial summation ; (3) simultaneous contrast phenomena ; and (4) inhibition in the retino-cerebral apparatus. Creed discusses the physiological interaction between the two retino-cerebral apparatus, and asserts that binocular fusion and rivalry of contours, of brightness, or of colour are mainly psychical

phenomena involving interplay between sensations and percepts There is no more than a slight degree of convergence of the conducting paths from corresponding areas of the two retinæ to form a final common path to the sensorium Examples are taken also from the sensations of pain cold, and heat originating in other organs and Creed adds that in the past far too little attention has been paid to such integrated mechanisms by most workers on the physiology of sense organs

214 Ascending Medullary Syphilis

L BOURRAT (*Journ de Med de Lyon* June 20th 1931 p 381) states that besides the common form of medullary syphilis giving rise to spastic paraplegia there exist, though rarely, flaccid paraplegias which are due neither to radiculitis nor to tabes since motor troubles with muscular atrophy alone attract attention, and sensory disturbances are absent Such a case is recorded, commencing as a flaccid paraplegia, with weakness in the lower limbs it developed into a quadriplegia without any pyramidal symptom Though the patient denied alcoholism and specific infection, the Wassermann reaction of both the blood and cerebro spinal fluid was strongly positive The complete absence of sensory symptoms excluded radiculitis or polyneuritis, and in conjunction with the results of laboratory tests, pointed to a medullary syphilis of poliomyelitic type The patient responded rapidly to treatment with mercury cyanide and novarsenobenzol before the muscular atrophy became pronounced The elective site of the disease is the anterior horns and as demonstrated anatomically, in the anterior radicular arteries Bourrat, agreeing with Lortat Jacob and Delille and Girot that medullary syphilis never occurs in regularly treated subjects, but mostly in those completely ignorant of their infection, believes that a similar ignorance is found in many cases of radiculitis yielding to arsenobenzol therapy In such cases an intensive specific treatment instituted early in the disease, always gives complete and rapid functional cure

Obstetrics and Gynaecology

215 The Action of Adrenaline on Abnormal Uterine Contractions

P RUCKER (*Gynecol et Obstet* May, 1931 p 412) states that adrenaline will cause an intense contraction ring in the pregnant uterus to disappear for a sufficiently long period to permit the performance of version or extraction by forceps Prolongation of labour is frequently due to an unrecognized contraction ring round the neck of the foetus A case is quoted in which a contraction ring in this position had proved resistant to deep anaesthesia A hypodermic injection of 0 5 c cm of a 1 in 1 000 solution of adrenaline caused the disappearance of the ring in a few minutes, it was then easily possible to extract the child by version As the effect of adrenaline is of short duration it sometimes becomes necessary to repeat the dose Since this preparation causes cessation of uterine contractions its use in threatened abortion is logical Rucker quotes a case in which by repeated injections parturition was postponed for three weeks after the first pains, normal delivery of a live child resulted

216 Pregnancy Toxaemia with Persistent Hypertension

R MITCHELL (*Canadian Med Assoc Journ*, July 1931 p 71) reports a case of recurrent toxaemia in a multipara which was associated with persistent hypertension The patient aged 46 came under observation owing to three pregnancies having been complicated by toxaemia and her systolic blood pressure remaining steadily over 200 Details are given of pregnancies in 1924, 1927 and 1929, respectively, these being the last three of nineteen pregnancies sixteen living children having been born the patient was apparently in good health until 1924 Mitchell remarks that the patient is still able to carry on her full duties as the mother of a large family, and it is difficult to diagnose the existence of a chronic nephritis since the urinary signs are negative although she undoubtedly has hypertension, which gives rise to such symptoms as severe headache He concludes that the strain of repeated pregnancy has been too great for the liver and kidneys bringing about serious crises in her last three pregnancies, during them albuminuria was present and casts were found Although renal efficiency tests have failed to reveal any kidney defects there is little reason to doubt that another pregnancy would be attended with a recurrence of the toxaemia Menstruation continues regularly, and such a possibility has therefore to be seriously considered The author adds that it is probable that after several years the hypertension will lead to arteriosclerosis of the kidneys

217 Protozoal Vaginitis

J P GREENHILL (*Journ Amer Med Assoc* May 30th, 1931, p 1862) finds that vaginitis due to *Trichomonas vaginalis* is fairly common in both pregnant and non pregnant women A profuse vaginal discharge is associated with burning or itching sensations in the vulva The vaginal mucosa is usually orange red and roughened and the discharge is greenish yellow foamy purulent and foul smelling The *Trichomonas* organisms are easily detectable in hanging drop preparations because they are actively motile For treatment Greenhill recommends thorough cleaning of the vulva and vagina with tincture of green soap washing this out with mercuric chloride or tap water applying hexyl resorcinol freely and inserting into the vagina tampons soaked in glycerin This treatment is repeated every two hours until two consecutive examinations of hanging drop preparations are found to be free from the organisms Patients should be re examined immediately before and just after the subsequent menstrual periods since recurrence of the infection then is not uncommon The author adds that the source of these parasites is still uncertain Some authorities hold that they pass from the rectum into the vagina but others believe that the intestinal form of *Trichomonas* is a different species The infection does not appear to be contagious

218 H G FURNELL (*Med Journ of Australia* May 16th 1931 p 604) discusses two cases of infection by the *Trichomonas vaginalis* which were at first suspected to be gonorrhoeal the motility of the infecting organism cleared up the diagnosis He employed the usual treatment of scrubbing the vagina with a swab using green soap and a little water After drying, the mucous surfaces were painted with 2 per cent mercurochrome and a glycerin tampon was subsequently introduced He is inclined to think that diathermy may prove effective in this condition

219 Uterine Bleeding from Essential Thrombopenia

According to B ZONDEK (*Zentralbl f Gynak* May 30th, 1931, p 1791) essential thrombopenia is a not very uncommon cause of severe uterine haemorrhage this may be the most prominent, or even the only clinical symptom The diagnosis is made by examination of the blood which shows a prolonged bleeding time usually a normal coagulation time and a striking reduction in the thrombocyte count The best treatment consists in blood transfusion, followed by *x* radiation in stimulant doses of the bone marrow irradiation of the spleen is more likely to do harm than good and improvement following splenectomy may be vitiated by relapses The case is described of a patient who at puberty had to remain in bed for three months on account of menorrhagia accompanied by bleeding from the nose and gums At the age of 23 to 25 these symptoms recurred in such a degree as to end [illegible] life, the platelet count was reduced by 94 per cent [illegible] the haemoglobin to 15 per cent Splenectomy was performed as a last resource and the patient [illegible] re establishment of the blood picture enjoyed [illegible] for four years until copious metrostaxis accompanied by generalized subcutaneous bleedings again [illegible] life Recovery now followed the transfusion of 200 c cm of blood and irradiation of the long bones of one leg

Pathology

220 Effect of Carbon Dioxide on Respiration

J. BARCROFT and R. MARGARIA (*Journ. Physiol.*, June 26th, 1931, p. 175) have experimentally investigated the effect of CO_2 inhalation upon human respiration. They find that the rates of both inspiration and expiration are quickened, and that the time taken by each phase is shortened. The rate of inhalation of air at the middle of inspiration varies almost exactly with the total ventilation. These variations were found by the authors to be the same for a person, whether the hyperpnoea was produced by CO_2 inhalation or by exercise. The maximum total ventilation produced by exercise was nearly twice as great as that produced by the highest concentration of CO_2 which could be breathed for a quarter of an hour. The authors conclude, therefore, that CO_2 inhalation and exercise act in a similar way, but the maximal effect of the first falls short of that of exercise. The breathing of 7.5 per cent. of CO_2 for twenty minutes produces a shock from which the system does not wholly recover for some hours. It seems clear that carbon dioxide can only be one contributory factor in the production of dyspnoea by exercise.

221 Bacteriolysis of Koch's Bacillus in the Tissues

After summarizing their previous work on the bacteriolysis of Koch's bacillus, C. RICHET, jun., DUBLINEAU, and R. COUDER (*Journ. de Physiol. et de Pathol. Générale*, June, 1931, p. 277) record the results of further experiments, which indicate that bacteriolysis is caused by healthy tissues; similar work on tuberculous subjects has not yet been undertaken. This bacteriolysis in the tissues is believed to be due to a chemical principle (not a bacteriophage), which is thermolabile and filterable; it belongs to certain proteins of animal origin, and was found to be particularly abundant in the hepatic, muscular, and globular proteins. While the important process in the cure of tuberculosis—namely, the elimination of the bacilli by the bile, urine, or intestine—is not ignored, the authors consider this chemical defence, either by the phagocytic ferments or more especially by the parenchymatous cells, to be a predominant factor.

222 Sedimentation of Red Cells

B. ENOCKSSON (*Acta Med. Scand.*, May 26th, 1931, p. 360) has shown that the electrolytes are determining factors in the sedimentation rates of red cells. Red corpuscles in one and the same suspension can be separated into at least two groups with different rates of sedimentation, suggesting that structural qualities of the corpuscles may also be of significance in determining the sedimentation rate. The author has also shown that this differentiation in the sedimentation rate may be caused by quite minute variations in salt concentration such as are not unlikely to occur *in vivo* under pathological conditions. It is suggested that the cause of these phenomena may consist in variations in agglutination produced by different salt concentrations, in conjunction with structural differences in the red cells which may be present even in the same blood.

223 The Suprarenals in Experimental Rheumatism

G. ALEXANDRESCO and MARIE LAUTIER (*Acta Rheumatologica*, May, 1931, p. 19) made a study of the lesions in the suprarenals of monkeys experimentally infected with the diplo-streptococcus of rheumatism, with the following results. The lesion bore a direct relation to the intensity, duration, and method of administration, and the form of the micro-organism. In attenuated parenteral infection of short duration the suprarenals showed a histo-physiological reaction in the form of overactivity which was most marked in the cortex; this reaction was in no way characteristic of rheumatic infection. In repeated and prolonged infection by the intestinal tract with the diplococcal form an extensive degeneration with defective function of the cortical parenchyma was found at the end of six weeks, together with an almost complete necrosis of the medulla, and an intense lympho-connective tissue reaction. In an attenuated and prolonged infection by the intestinal tract the suprarenal parenchyma at the end of three months was much reduced quantitatively and qualitatively, both in the cortex and in the medulla, and there was an intense connective tissue reaction. Generally speaking, in experimental rheumatism in monkeys the suprarenals are constantly affected, but, contrary to what the authors found in the case of the thyroid gland, the histological reactions were in no way characteristic.

224 Morbid Histology of Pink Disease

Very few necropsies in pink disease have included a microscopical examination of the nervous system, and, therefore, W. G. WYLLIE and R. O. STERN (*Arch. Dis. in Childhood*, June, 1931, p. 137) record the results of the histological examination of this system in seven cases. In all of these the spinal cords showed the diffuse infiltration with small cells first described by Paterson and Greenfield, and considered by those investigators to be glial rather than haematogenous. The present authors agree with this conclusion, but they could not demonstrate the existence of cellular processes by either neuroglial or microglial staining methods. Chromatolysis of the central type was found in the anterior horn cells of the spinal cord in five cases; it was more apparent in the lumbo-sacral region, particularly extensive in the most chronic case, and clearly due to an "axonal reaction." In only two instances was there any abnormality above the level of the medulla. The authors conclude that the essential lesions in pink disease appear to be situated in the skin and in the nervous system, though it is probable that the skin lesion is not pathognomonic. In all the cases the clinical symptoms were much in excess of the pathological findings, although cellular infiltration was always present, and degeneration of the peripheral nerves was found in four cases. Discussing the pathogenesis of this condition, the authors remark that vitamin deficiency can be excluded, and that no history of a preceding infection or the presence of an inflammatory cervical adenitis was obtained. Liver therapy proved effective in the general condition of some of the patients under observation, the irritability and pain quickly subsiding, and there being no recurrence.

225 Yellow Fever in White Mice

J. E. DINGER (*Zentralbl. f. Bakt.*, June 24th, 1931, p. 194) has confirmed and extended the work of Theiler on the susceptibility of the white mouse to yellow fever. The intracerebral inoculation of mice with 0.05 c.cm. of infective blood from a *rhesus* monkey gives rise, after an incubation period of five or six days, to an illness characterized by ruffling of the coat, loss of the usual activity, photophobia, paresis of the hind legs, tonic and clonic contractions of the whole body, and finally coma and death in six to nine days. At the necropsy there is found an acute encephalitis, often accompanied by dilatation of the skin vessels, swelling of the lymph glands, haemorrhages into the stomach, erosion of the gastric mucosa, fatty degeneration of the liver, and enlargement of the suprarenals. Microscopically the brain shows dilatation of the capillaries, proliferation of the vascular endothelium, and cellular infiltration, but no specific eosinophilic inclusion bodies, similar to those described by Torres, are to be found in the ganglion cells. By the intracerebral passage of the brain suspension the disease can be carried on indefinitely through mice, and even after eighteen passages the virus is still capable of giving rise to typical yellow fever in monkeys. In the mouse the virus has a strong neurotropic affinity, being limited in distribution to the central nervous system and the suprarenals. Infection is possible by the subcutaneous, intramuscular, and intraperitoneal routes, but the proportion of positive results is lower than after intracerebral inoculation, which is almost uniformly successful. Filtration experiments with brain suspension in 10 per cent. rabbit serum showed that the virus readily passed through Seitz filters; saline solution was found unsuitable for making suspensions, since it killed the virus very rapidly. The filtrates can be neutralized by immune monkey serum.

FELAMINE BRAND SANDOZ

SANDOZ

An association of the most powerful cholagogue—pure crystallised cholic acid—and the classical biliary disinfectant—hexamine, entirely free from accessory substances.

Indications:

CHOLANGITIS, CHOLECYSTITIS, HEPATIC INSUFFICIENCY, HEPATIC CONGESTION, JAUNDICE, CHRONIC CONSTIPATION.

Felamine is supplied in Bottles of 50 and 250 Tablets.

THE "PHONOPHORE" STETHOSCOPES

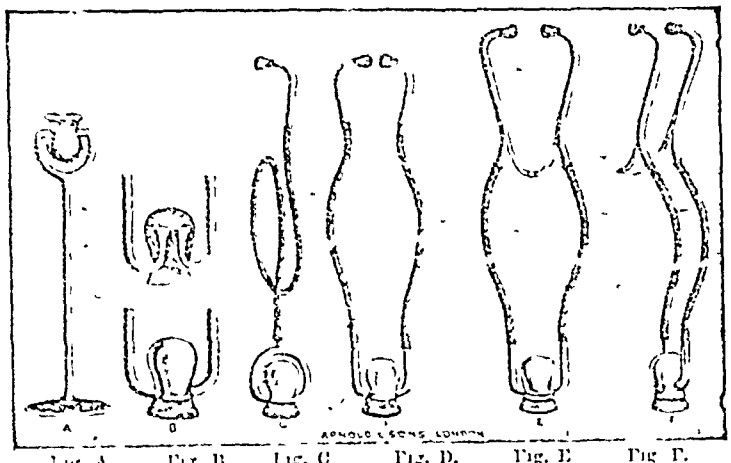

Fig. A. Rigid Stethoscope 12/6 — Fig. B Chest Piece 8/6 — Fig. C Single Flexible 12/6 — Fig. D. Double Flexible 15/- — Fig. E Binaural 15/6 — Fig. F. Folding 16/6

Some Unsolicited Appreciation

Dear Sirs,—I beg to thank you for the best stethoscope I ever used, and during the last forty years I have used a good many.
Yours faithfully, ——

Dear Sirs,—I find that most certainly the chest sounds are rendered clearer and more distinct by your "Phonophore" than by any Stethoscope I have used during over thirty years' work.—Yours faithfully, ——

Dear Sirs,—I find your "Phonophore" indispensable. Being more or less deaf, without it I should be compelled to relinquish practice. With it I can hold my own.
Yours faithfully, ——

Dear Sirs,—The "Phonophore" is extremely satisfactory and far superior to any stethoscope I have used.
Yours truly, ——

FOR DEAFNESS

Doctors prefer "ARDENTE" because—

1. It is individually fitted to suit the case for young, middle-aged, or old.
2. It is simple and true-to-tone, and leaves the hands free.
3. It removes strain, thus relieving head noises, giving inconspicuous hearing.
4. It conveys sound from varying ranges and angles.
5. It is entirely different, uncopyable, and carries a guarantee and service system.
6. It is suitable for "hard of hearing" or acutely deaf through various causes.
7. It is helpful for conversation, music, talkies, wireless, home, office, public work, and sports.

FREE HOME TESTS
arranged for Doctors and Patients.
Medical Prescriptions made up to the minutest detail.

"ARDENTE" STETHOSCOPE.
Mr. R. H. Dent makes a Stethoscope specially for members of the medical profession suffering from deafness. Many are in use, and excellent results are reported on the latest, as evidenced by the interest shown at the last B.M.A. Meeting

MEDICAL REPORTS
Commended by all leading medical journals.—Mr. Dent will be happy to send full particulars and reprints on request.

An IMPROVED and MODIFIED

Portable Traction Apparatus

An exceedingly efficient and convenient apparatus for putting up in plaster the lower limbs or trunk, also when applying bone plates or Parham and Martin's Bands to long bones of the lower extremity. Provides the more essential movements of expensive and bulky Orthopaedic tables at a fraction of the cost.

Quickly adaptable for the following positions:

Extension of whole lower limbs
Movements about hip joint
Abduction to any degree—
Hyperextension—Flexion—
Internal and External Rotation.
Flexion of knee joint
Inversion and Eversion of foot.

SAVES BEDS IN HOSPITALS

A limb may now be put up in plaster, the patient sent home and transported for subsequent treatment by ambulance. By thus freeing beds this new apparatus saves its cost many times over.

Folds compactly for storage or transit in plywood case 33in × 15in. × 11in.

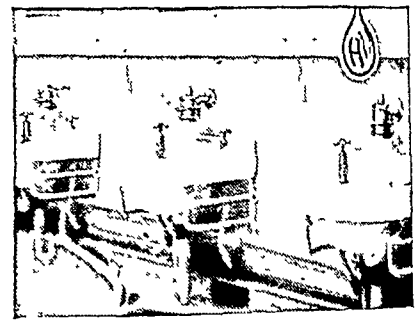
FRESH LIQUID TOILET SOAP



for each user—and

ECONOMY

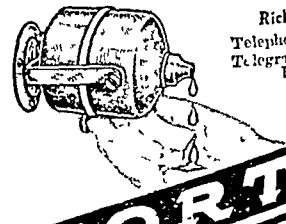
for the provider

ASSURED WITH THE

DROP by DROP SYSTEM

Part of a Horton Liquid Toilet Soap installation at the NEW VICTORIA CINEMA.

HORTON have now produced a perfect toilet soap in liquid form; a liquid toilet soap entirely free from cocoanut oil and therefore non-irritating to delicate skins.



And further, to make the Dispensing apparatus as perfect as the liquid toilet soap, Horton have developed the ideal container in non-tarnishable oxyplatine metal incapable of forming verdigris.

Thus you have the perfect liquid toilet soap, the perfect container, and the perfect service—clean, fresh soap; served drop by drop to each user. No waste, no infection risk, no pilfering, no clogged pipes.

Save money by stating your requirements. Horton will gladly quote you by return

SOMNIGEN

The advantage of "Somnigen" is that it does not produce the Headache, Nausea, Furred Tongue, or Constipation so frequently noticed when preparations of Opium or Morphine are administered. It contains the whole of the Alkaloids of Opium in chemical combination with Hydrobromic Acid which assists the sedative action, and is STANDARDISED so as to contain 0·75 per cent. Morphine, but entirely free from nauseous odour and characteristic taste.

As an Hypnotic, Sedative, Opiate and Diaphoretic it has always given great satisfaction, as its action is most regular and certain, producing refreshing sleep without unpleasant after-effects.

"It is free from the odour of the ordinary Tincture of Opium and does not produce the same disagreeable after effects."
—THE MEDICAL ANNUAL

"It has the advantage of not being followed by nausea and headache and other drawbacks of Laudanum."
—THE INDIAN MEDICAL GAZETTE

The Ideal Laxative

REGULOL

REGD.

IT is a highly palatable Emulsion of Liquid Paraffin with Agar-Agar, possessing all the advantages of the former without its objectionable qualities, and forming probably the best possible remedy for Chronic Constipation in Children and Adults.

"Regulol" is available in two forms "PLAIN" or "COMPOUND." The latter is a combination with Phenolphthalein 1 grains per oz., and is indicated in more acute forms of Constipation where the simple lubricating effect of Paraffin is insufficient.

ST. ANDREW'S HOSPITAL
FOR MENTAL DISORDERS.
NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY.

President: THE MOST HON. THE MARQUESS OF EXETER, C.M.G., A.D.C.

Medical Superintendent: DANIEL F. RAMBAUT, M.A., M.D.

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients, who are suffering from incipient mental disorders or who wish to prevent recurrent attacks of mental trouble; temporary patients; and certified patients of both sexes, are received for treatment. Careful clinical, biochemical, bacteriological, and pathological examinations. Private rooms, with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE.

This is a Reception Hospital in detached grounds, with a separate entrance, to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods, including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical bath, Plombières treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray Room, an Ultra-violet Apparatus, and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological, and pathological research.

MOULTON PARK.

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit, and vegetables are supplied to the Hospital from the farm, gardens, and orchards of Moulton Park. Occupation therapy is a feature of this branch, and patients are given every facility for occupying themselves in farming, gardening, and fruit-growing.

BRYN-Y-NEUADD HALL.

The seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres, at Llanfairfechan, amidst the finest scenery in North Wales. On the North-West side of the Estate a mile of sea coast forms the boundary. Patients may visit this branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout-fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses, and bowling greens. Ladies and gentlemen have their own gardens, and facilities are provided for handicrafts, such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 56, Northampton), who can be seen in London by appointment.

THE COPPICE, NOTTINGHAM.
HOSPITAL FOR MENTAL DISEASES.

This Institution is exclusively for the reception of a limited number of Private Patients of both sexes of the Upper and Middle Classes at moderate rates of payment. It is beautifully situated in its own grounds on an eminence a short distance from Nottingham, and from its singularly healthy position and comfortable arrangements affords every facility for the relief and cure of those mentally afflicted. Voluntary and Temporary Patients received.

Tel.: 64117. *For terms, etc., apply to the Medical Superintendent*

President: LORD WAKEFIELD OF HYTHE, C.B.E., LL.D.
Treasurer SIR LIONEL FALDEL-PHILLIPS, Bart
Physician-Supt.. J. G. PORTER-PHILLIPS, M.D., F.R.C.P.

This Registered Hospital is now situated at Monks Orchard, in some 250 acres of park, pleasure, and farm grounds.
Applications can be considered on behalf of patients of the educated classes in a presumably curable condition.
With a view to early treatment voluntary or uncertified patients are admitted
Patients who can contribute 5 guineas weekly towards the cost of treatment and maintenance may be received as vacancies arise.
The Committee will also consider applications for admission at lower rates, and in certain cases will be prepared to admit patients free of charge
Every facility for specialized investigation and treatment is provided in the Lord Wakefield Science and Treatment Unit. In this Unit is found the X-ray and Dental Departments and the Bio-Chemical, Pathological, and Psychological Laboratories.
Furthermore, provision is made for Electro-Therapy and Hydro Therapy to be carried out in all their forms
In addition to the Resident Medical Staff, Consultants in special branches of Medicine and Surgery are available whenever required.
The comfort of sensitive patients is greatly enhanced by the fact that the majority are given single bedrooms
For forms and further particulars apply to the Physician-Superintendent at the Hospital

The Queen Alexandra Sanatorium FUND.

A limited number of GRANTS will be made during the Autumn from this Fund to help British patients of small means suffering from Pulmonary Tuberculosis to obtain Treatment at Davos, Switzerland. Applications should be made before the end of September. Forms and particulars may be obtained from Mr. W. G. LOCKETT, Davos Platz, Switzerland.

LONDON HOSPITAL MEDICAL COLLEGE & DENTAL SCHOOL.

THE WINTER SESSION will Open on Thursday, October 1st.

The Hospital is the largest in England. There are 859 beds in constant use. Last year's number of in patients, 14,256; out patients, 86,554; attendances, 529,543; dental patients, 6,063; major operations, 7,401.

The MEDICAL COLLEGE and DENTAL SCHOOL are essentially modern, with large laboratories equipped with the latest and the most approved appliances. The STAFF is so large as to permit of individual attention being paid to all students.

MEDICAL UNIT—A Clinical Unit in Medicine, under the charge of a whole time Director, provides for the more elaborate methods of diagnosis and treatment, and takes a leading part in the initiation and coordination of medical research.

RESEARCH FUNDS of approximately £113,000 give unrivalled facilities for Medical Research.

SCHOLARSHIPS and PRIZES to the value of £1,158 are awarded annually, including four Open Entrance Scholarships to the value of £360 and two Entrance Scholarships open to students of the Universities of Oxford and Cambridge to the value of £200.

APPOINTMENTS—Over 160 Appointments are made annually from Students of the College recently qualified.

SPECIAL COURSES are held for all the University Examinations, for the Primary and Final Fellowship Examination of the Royal College of Surgeons, and for the Membership Examination of the Royal College of Physicians.

HOSPITAL PRACTICE—*Exceptional opportunities are offered to qualified Practitioners* wishing to attend the General Practice or the Practice of a Special Department of the Hospital.

A Club's Union, an *Athletic Ground* of over 13 acres, and a *Student's Hostel* promote the recreation, health, and comfort of the Students.

For Prospectus and Particulars apply to the Dean (Professor WILLIAM WRIGHT, M.B., D.Sc., F.R.C.S.), who will be pleased to make arrangements for anyone wishing to see the Medical College and Dental School.

The officer appointed should either have held a previous appointment as Medical Officer of an Ante-natal Clinic, with the approval of the Ministry of Health, or have had at least three years' experience in the practice of his or her profession, and special experience of practical Midwifery and Ante-natal work. The holding of a Diploma in Public Health will be deemed an *additional qualification for the post.*

The successful candidate will be required to act as Resident Medical Officer at the Council's Maternity and Children's Hospital (45 beds), and perform duties in connection with the *Maternity and Child Welfare Scheme, including* infant welfare and ante-natal clinics; duties in connection with the School Medical Service, and, in addition, such other duties as may be required from time to time by the Medical Officer of Health.

The salary will be at the rate of £500 per annum, rising by *annual increments of £25* to a maximum of £700 per annum, *subject to a deduction of £125 per annum for board,* lodgings, and laundry.

The appointment is subject to the provisions of the Local Government and Other Officers Superannuation Act, 1922, and the selected *candidate will be required to pass a medical* examination.

Application forms, together with conditions of service, may be obtained from the Medical Officer of Health, Public Health Department, St. James's Street, Burnley, to whom applications, accompanied by copies of three recent testimonials, *should be forwarded not later than* Wednesday, September 30th.

Canvassing, either directly or indirectly, will be a disqualification.

COLIN CAMPBELL,
Town Hall, Town Clerk.
Burnley.

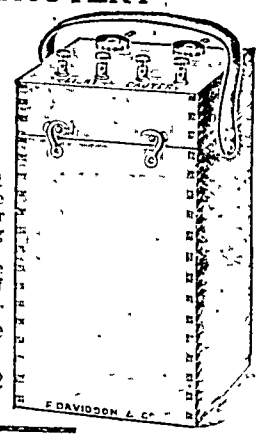
WE MODERNS PREFER

electric lights  to old oil lamps  and motor cars  to the horse and gig  of an earlier age  because we get results more quickly and more efficiently.

Similarly in constipation — a modern day has developed a modern way — AGAROL. To meet every modern need, this product combines efficiency with palatability. No oily taste, no artificial flavouring to get used to.

AGAROL Brand Compound is the original mineral oil and agar-agar emulsion with phenolphthalein. It softens the intestinal contents and gently stimulates peristalsis.



Effectiveness must be experienced.
A supply gladly sent for trial.

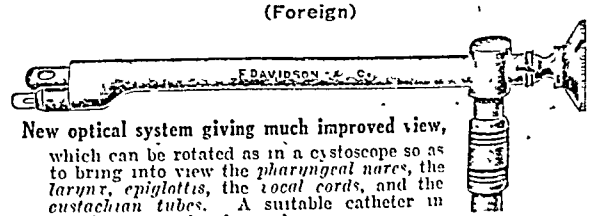
Perfect appliances, impossible to get out of order.



THE "DENIS BROWNE" HEAD LAMP.

No. 516. £2 17 6.

"This gives a more brilliant and concentrated beam than any other on the market. At the ordinary working distance of 15 inches it gives a perfectly clear, evenly illuminated field of 4 inches in diameter which changes very little at longer or shorter working ranges. Its only adjustment is single strong hinged joints, which gives all the directions of the light which are needed, and, in addition, it does not project forward from the operator's face."
DENIS BROWNE, F.R.C.S.

LARYNGO-PHARYNGOSCOPE
(Foreign)

New optical system giving much improved view, which can be rotated as in a cystoscope so as to bring into view the *pharyngeal nares*, the *larynx*, *epiglottis*, the *vocal cords*, and the *eustachian tubes*. A suitable catheter in position is easily observed.

"I have found it invaluable."——, M.D., 17/12/29

Syrup Cocillana Comp.

PARKE, DAVIS & CO.

THIS thoroughly efficient soothing and expectorant combination is particularly adapted for the treatment of acute bronchitis; also of chronic bronchitis when secretion is scanty and cough excessive. In the inter-paroxysmal stages of asthma, its administration is useful to allay dyspnœa. It does not arrest the secretions or cause constipation. It is most agreeable in flavour and attractive in appearance.

Each fluid drachm contains:—

Tincture of Cocillana	5 mins.	Fluid Ext. of Squill	1/4 min.
Tincture of Euphorbia Pilulifera	15 mins.	Fluid Ext. of Senega	1/4 min.
Syrup of Wild Lettuce	15 mins.	Tartarated Antimony	1/184 gr.
Cascarin (P., D. & Co)	1 gr	Menthol	1 100 gr.
Ethylmorphine Hydrochloride	1 32 gr.		

Syrup Cocillana Compound (P., D. & Co.) is supplied in bottles of 4, 8, 16 and 80 fl. ounces.

Parke, Davis & Co., 50 Beak Street, London, W. 1.

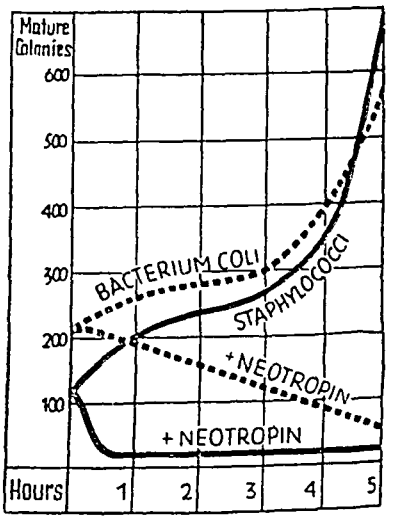
A urinary antiseptic of remarkable powers of penetration and tissue affinity, -highly bactericidal

Indicated in

infective disease of the genito-urinary tract, bacteriuria, cystitis, pyelitis, pyelonephritis, gonorrhoeal complications, and as a disinfectant before and after surgical interference.



PACKINGS:

Bottles of 30 dragées of 1.5 grains.
Bottles of 250 dragées of 1.5 grains.

DOSAGE:

2 dragées to be swallowed three times daily, according to the requirements of the case.

Sample and literature on request from

The curves show the increase in growth of bacteria in ordinary urine compared with the decrease in growth produced by Neotropin

SCHERING LIMITED, 3, LLOYD'S AVENUE LONDON, E.C.3

J. & A. CHURCHILL

CAESAREAN SECTION

An Analysis of 352 Consecutive Cases of the Classical Operation with an Account of the Technique Employed
By M. H. F. IVENS KNOWLES, C.B.E., M.S., M.B. 5s. Postage 3d.

6 Col. Plates. 21 Text figures. 21s. Postage 9d.

LABORATORY DIAGNOSIS—CLINICAL APPLICATION

By F. E. OSGOOD, M.D., Director of Laboratories, University of Oregon, and H. D. HASKINS, M.D., Professor of Biochemistry, School of Medicine, University of Oregon.
CONTENTS.—Kidneys, Urinary Tract, Nephritis, Diabetes, Pregnancy, Central Nervous System, Gastro-Intestinal, Ductless Glands, Thyroid, Hæmatology, Respiration, Heart, Laboratory Methods.

SECOND EDITION. 20 Plates. 34 Text figures. 15s. Postage 9d.

RECENT ADVANCES IN THE DISEASES OF CHILDREN

By WILFRED J. PEARSON, D.S.O., Physician, Children's Department, University College Hospital, and W. G. WYLLIE, M.D., Physician, Out-patients, Hospital for Sick Children, Great Ormond Street.

98 Illustrations, including 4 Coloured Plates. 12s. 6d. Postage 9d.

RECENT ADVANCES IN ALLERGY

(Asthma, Hay-Fever, Eczema, Migraine, etc.)

By G. W. BRAY, M.B., Ch.M., Asthma Research Fellow, Hospital for Sick Children, Great Ormond Street, London.
With a Foreword by A. F. HURST, M.D., F.R.C.P., Senior Physician, Guy's Hospital.

23 Illustrations. 7s. 6d. Postage 4d.

ELEMENTARY HISTOLOGICAL TECHNIQUE FOR ANIMAL AND PLANT TISSUES

By J. T. HOLDER, F.R.M.S.

THIRD EDITION. 170 Illustrations. 24s. Postage 9d.

FORENSIC MEDICINE

By SYDNEY SMITH, M.D., D.P.H., Regius Professor of Forensic Medicine, University of Edinburgh.

SECOND EDITION. 16 Illustrations. 12s. 6d. Postage 6d.

RECENT ADVANCES IN TROPICAL MEDICINE

By SIR LEONARD ROGERS, C.I.E., M.D., F.R.C.P., F.R.C.S., F.R.S., Physician and Lecturer, London School of Tropical Medicine.

4 Coloured Plates and 73 Text figures. 12s. 6d. Postage 6d.

RECENT ADVANCES IN ANATOMY

By H. WOOLLARD, M.D., University Professor of Anatomy, St. Bartholomew's Hospital Medical School.

MITCHELL'S RECENT ADVANCES IN ANALYTICAL CHEMISTRY

Vol. I. Organic.

Sugar Analysis.—Oils and Fats.—Essential Oil.—The Proteins (with Biological Analysis of Proteins).—Tannin.—Cereal.—Milk and Milk Products.—Paper.—Petroleum and its Hydrocarbons.—Coal.—Gas.
27 Illustrations. 15s. Postage 9d.

Vol. II. Inorganic.

Hydrogen ion Concentration.—Common Metals.—Rare Earth Metals.—Platinum Metals.—Micro-chemical Analysis.—Water.
26 Illustration. 15s. Postage 9d.

4 Illustrations. 12. 6d. Postage 6d.

RECENT ADVANCES IN PSYCHIATRY

By HENRY DEVINE, O.B.E., M.D., F.R.C.P., Medical Superintendent, Holloway Sanatorium, Virginia Water.

SECOND EDITION. 15 Illustration. 7s. 6d. Postage 4d.

COW'S SYNOPSIS OF PHARMACOLOGY

Revised by G. NORMAN MYERS, M.D., B.S., M.Sc., Pharmacological Laboratory, University of Cambridge.

180 Illustrations. 10. 6d. Postage 6d.

REFRACTION OF THE EYE, INCLUDING PHYSIOLOGICAL OPTICS

By CHARLES GOULDEN, *O.B.E., M.D., M.C., F.R.C.S.*, Ophthalmic Surgeon, London Hospital, and Surgeon, Royal London Ophthalmic Hospital. Introduction by SIR JOHN HERBERT PARSONS, C.B.E., F.R.C.S., F.R.S.

FIFTH EDITION. 1054 pages. 543 Illustrations. 21s. Postage 9d.

STARLING'S HUMAN PHYSIOLOGY

Edited and Revised by C. LOVATT EVANS, D.Sc., F.R.C.P., F.R.S., Jodrell Professor of Physiology in University College, London. With chapters on the Central Nervous System and Sense Organs revised by H. HARTRIDGE, M.A., M.D., Sc.D., F.R.S., Professor of Physiology, St. Bartholomew's Medical College.

"Professor Lovatt Evans has accomplished his difficult task with complete success."—B.M.J.

THIRD EDITION. 22 Illustrations. 12s. 6d. Postage 6d.

RECENT ADVANCES IN HAEMATOLOGY

By A. PINEY, M.D., Ch.B. (Birm.), M.R.C.P., Director, Pathological Department, Cancer Hospital, London.

SECOND EDITION. 115 Illustration. 15s. Postage 9d.

OGILVIE'S RECENT ADVANCES IN SURGERY

"We confidently expect further editions of this admirable book."—BRITISH MEDICAL JOURNAL.

NEW WORK. NOW READY.

MODERN MEDICAL TREATMENT

By E. BELLINGHAM-SMITH, M.D., F.R.C.P.Lond., and ANTHONY FEILING, M.D.Cantab., F.R.C.P.Lond.

With an Introduction by Sir HUMPHRY ROLLESTON, Bart., G.C.V.O., K.C.B.

The subject of therapeutics is here presented from the aspect of the disease, and not from that of the remedies employed. In each instance a brief summary of etiology and symptoms precedes the details of treatment. While doing justice to the older methods the Authors have included all the recent advances in therapeutics which they have found serviceable. In his Introduction Sir Humphry Rolleston speaks of MODERN MEDICAL TREATMENT as an "attractive" work, "most conveniently planned for the reader's benefit."

Two Volumes, Demy 8vo. 1,432 pages. 30s. net the set.

NEW WORK. NOW READY.

RADIOLOGY IN RELATION TO MEDICAL JURISPRUDENCE

By S. GILBERT SCOTT, M.R.C.S., L.R.C.P., D.M.R. & E.Cantab.

Dr. Gilbert Scott's aim is to help those who have to deal with claims for compensation for injuries, whether as radiologists, as medical witnesses, or as counsel. His book, based upon the material that passed through his hands as Director of the Radiological Department of the London Hospital, deals mainly with those skeletal variations that are likely to mimic fractures and other injuries. The text is elucidated by twenty-four beautifully reproduced radiographs.

Demy 8vo. 76 pages. With 24 Radiographic Plates. 7s. 6d. net.

SURGICAL SERVICE
SALTAIR

"SALTAIR SURGICAL SERVICE"

Specialisation in Service

The outstanding feature of Saltair Surgical Service is the fact that every appliance is specially made for each individual requirement, as prescribed by the attendant practitioner.

Many of our appliances are our own patents, and are registered patterns. New types are constantly being added, and we cordially invite the Medical Profession to co-operate with us in experimenting in new designs —at OUR expense.

All correspondence (excepting regarding London appointments) should be addressed to Birmingham.

'Phone (Birmingham) - Midland 5455.

SALT AND SON LTD.

ESTABLISHED 1793

X-RAY YOUR PATIENTS

wherever they are——
at surprisingly low cost

Negatives developed within 10 minutes—perfect results assured

THE METHOD and its results

The apparatus is assembled at the patient's bedside and one small line, carrying both the electric and signal wires, is led from the car through any convenient window. The driver on the car then supplies current as and when required by the radiographer.

Immediately the exposures are made the films are developed on the car, and the finished negatives are ready to be seen within about ten minutes.

A Potter-Bucky diaphragm and fluorescent screen are also carried. Great penetration of any part of the body is ensured, and the definition of the negative is rendered equal to that of any permanently installed apparatus.

VERY often it is inadvisable to move a patient for an X-ray examination. More often still the advantages of such an examination cannot be enjoyed because of the difficulties involved. To-day in such cases as these X-ray examinations can equally well be made at the patient's bedside.

Powerful portable apparatus is available day and night for service anywhere—under the control of experienced radiographers.

Within forty minutes of arriving at a house the negatives are ready for inspection—the films being developed on the car, which is fitted up as a dark room.

The taking of the radiographs can be conducted throughout under the supervision of the medical practitioner concerned.

Seven years' experience in X-ray car service has produced a simplicity of service and a speed of working which constitute a unique service to the medical profession—making possible the more constant use of radiography at surprisingly low prices.

Any medical practitioner is invited to study the results of this method of radiography at any time on application to the Company.

Full details, in the form of an interesting descriptive booklet, will gladly be sent on request.

Write, wire or telephone to-day——

Special attention for urgent calls

The charges are graded according to the distance travelled from London—the basic charge within 10 miles of London being only four guineas, and one guinea for each subsequent radiograph at the same visit.

Special terms for hospitals.

AUTHORITIES ENDORSE ALUMINIUM FOR HEALTHY COOKING

The world-wide use of aluminium ware reveals a growing appreciation of the metal for its hygienic, economic, and labour-saving qualities. Parallel with public approval is the ready endorsement of the metal by British and American medical authorities, the German Board of Health, and other recognised experts.

1 BRITISH

The LANCET *report, 4th January, 1913, concluded: "We are confident that Aluminium, as it is now made by reputable manufacturers, is a useful material for cooking vessels and that any suspicion that it is a dangerous poisonous qualities to find in the process of cooking is entirely baseless and unsupported by the results of the practical experiments recorded above. The metal is not affected by acetic acid or by cooking of fatty substances." This verdict was confirmed by a further investigation, conducted under the auspices of the* LANCET, *and reported in the issue of 15th December, 1928.*

The BRITISH MEDICAL JOURNAL *19th August 1922 stated: "Aluminium is the best material to adopt for pots and pans for cooking, after all. It is a thin silver, possesses more readily, cooked food than any other metal. Aluminium has the advantage of not corroding, and so the question of poisoning from the results of the corrosion suffered even if the cooking utensils have been of bad Aluminium would be a matter of the greatest consequence, but there is no other consideration to affect every ordinary household, as well as of drinking water."*

A résumé of published evidence by British, American and Continental medical authorities, will be sent gratis on request.

ALUMINIUM INTELLIGENCE BUREAU, (6th Floor), Adelaide House, London, E.C.4.

"VARIBAN"

Elastic Plaster BANDAGE

MADE from a specially woven selvedge material, possessing very elastic properties, evenly spread with an Antiseptic Zinc Oxide Paste. Self-adhesive, readily conforming to the shape of the limb, and when carefully applied forms an even surface dressing which will not crease or slip. Firm support. Easy to remove. Extensively used in many well-known hospitals for the treatment of VARICOSE ULCERS, VARICOSE VEINS, SURGICAL and ORTHOPAEDIC CASES, etc. Their application for treatment of Varicose Ulcers, etc., does not necessitate the patient lying-up; in fact, permits the continuance of light duties. Ensures rapid healing.

SUPPLIED in WIDTHS

2"	2½"	3"

Proverbs Up-to-date No 4

YOU'RE THE DOCTOR

A *Doctor* is one who teaches. A *Physician* is one who, by medical means, so assists the natural tendency towards *cure* that the human body displays in so many cases that ultimate recovery may be looked for. Where *cure* is impossible, as in some Dental diseases, the only satisfactory course is *Prevention*.

And that is where Gibbs Dentifrice joins forces with every scientific and up-to-date Doctor and Dentist. It makes a valuable contribution to Preventive Dentistry. By powerful national advertising, and the constant reiteration of a few simple wholesome precepts, Gibbs urge upon the public the vital necessity for absolute cleanliness of the mouth, in preserving the teeth. And in Gibbs Dentifrice is provided the combination of ingredients that leading Medical Authority has prescribed as the most efficient for life-long use.

No extravagant claims are made for Gibbs Dentifrice Never is it suggested that Gibbs Dentifrice obviates the need for professional advice. In fact, the most frequently recurring phrase in Gibbs Advertising is: "Visit your Dentist twice a year and use Gibbs Dentifrice twice a day."

GIBBS MOUTHWASH
A Peroxide Mouth Wash in Powder form. A new Preparation by Gibbs that has met with instant success.
Gibbs Mouth Wash produces Oxygen in the mouth, which has a wonderfully efficient cleansing and antiseptic effect; and definitely purifies the breath.
Although intended for twice daily household use, Gibbs Mouth Wash provides an excellent and safe mouth wash for use following extractions.

Gibbs Dentifrice
BRITISH MADE

HORLICK'S

HORLICK'S MALTED MILK is as popular with the Medical Profession to-day as at any time during its history of half-a-century. It is a pure, clean, modified milk-food which keeps indefinitely and in any climate. Its cream-like consistency, its palatability, and its ease of digestion and assimilation, make it a safe, bland and soothing diet. Combining the nutritive qualities of pure fresh milk and the soluble extracts of malted barley and wheat, Horlick's is as valuable in infancy as in old age, in illness as in health. The Horlick process conserves the vital qualities of the constituent food materials and at the same time destroys pathogenic organisms. As a substitute for an ordinary milk diet Horlick's safeguards against outbreaks of typhoid and other fevers, septic sore throats, dysentery and other milk-borne diseases. To ensure the benefits of fresh milk without any of its dangers—prescribe Horlick's, hot or cold. Horlick's Malted Milk Co. Ltd., Slough, Bucks.

IN ALL DISORDERS ASSOCIATED WITH PYREXIA

BY APPOINTMENT

These essences supply stimulus without strain to the digestive system . . .

In illnesses when the patient is unable to assimilate solid food—and in convalescence when recovery is hampered by anorexia—Brand's Essences of Beef or Chicken provide stimulus while conserving the patient's energy.

Even in cases of very advanced stomach atonicity these essences make possible an amazingly quick return to normal tone and acidity. Suave and non-irritating in their action, digested forty minutes quicker than ordinary foods.

That is why 99 out of every 100 doctors recently interviewed are recommending Brand's Essences of Beef or Chicken. They find them indispensable in the treatment of specific fevers, in cases of intestinal disturbances, before and after operations, and particularly now in the post-influenzal state when the system must be prepared to digest a solid diet.

Brand's Essences of Beef or Chicken are hygienically prepared under scientific control by an exclusive process. They consist of the pure juices of the finest freshly killed English meats without added colouring matter or preservatives.

Clear, appetizing essences of beef or chicken, easy to swallow and delicious to taste. Samples will be gladly sent on receipt of a professional card. Dept. F.38, Brand & Co., Ltd., Mayfair Works, South Lambeth Road, London, S.W.8.

PYRIDIUM

in the treatment of

URINARY INFECTIONS

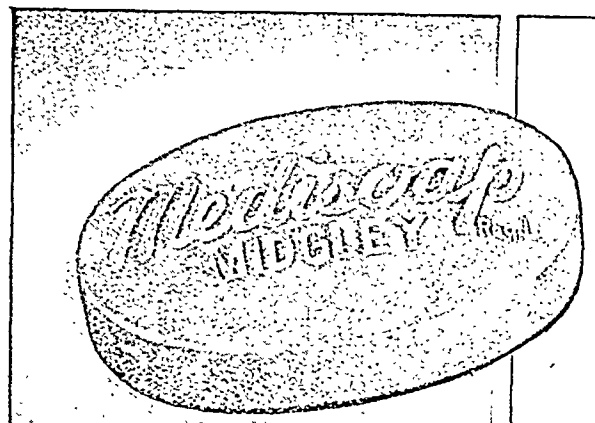
including

Cystitis **Pyelitis**

Gonorrhoea **Prostatitis**

Epididymitis **Vaginitis**

etc.



Pyridium given by mouth in the form of 0.1 gram tablets is of distinct service to the general practitioner as a Urinary Antiseptic, and will greatly enhance the value of the usual local measures in the treatment of coccal, B. Coli, and mixed infections. Pyridium, which is non-toxic and non-irritative in medicinal dosage, is early eliminated in sufficient strength in the urine to exercise a continuous antiseptic effect, and by its penetrative power reaches the submucous areas not ordinarily accessible to therapeutic agents.

Pyridium is the registered trade mark of the Pyridium Corporation of New York to designate its preparation of phenyl azo-alpha-alpha-diamino-pyridine hydrochloride.

Literature and samples gladly furnished on request.

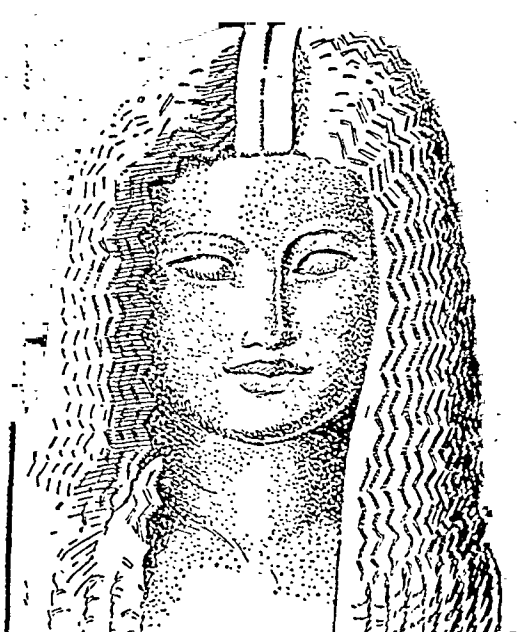
OVALTINE

FOR THE AGED

"Ovaltine" is delicious sustenance for old people. It sustains life ideally by giving tone to the tissues and promoting the healthy activity of the bodily functions. "Ovaltine" provides complete nourishment in easily assimilable form. Its use greatly increases the nourishing value of other foods. The digestibility of milk, for instance, so largely used in old age, is increased two-fold by adding "Ovaltine" to it, while the starch in the cereals is converted into easily assimilated malt sugar by the enzyme diastase which "Ovaltine" contains in abundance.



"Ovaltine" is purin-free. Its use, therefore, neither aggravates, nor favours the accumulation of uric acid in the system, nor leads to kidney disorder or gout. The tendency to constipation, so common in old age, is avoided by the use of "Ovaltine."

"Ovaltine" replaces to great advantage the usual meal-time beverages, tea and coffee, which are valueless as sources of nourishment and often contraindicated in senility.

A liberal supply for clinical trial sent free on request.

". . . . however much calcium and phosphorus is available the bones and teeth are imperfectly formed unless there is an adequate supply of Vitamin D (the antirachitic or calcifying vitamin)."

(Report of Hastings lecture on "Diet and Health," vide Supplement "B M J", March 21st, 1931, p. 85)

That the correct development of the skeletal frame and the regular architecture of the teeth of every child is dependent upon the ingestion of a sufficiency of Vitamin D is now generally recognised.

It is well known also that the normal dietary is often deficient in this vitamin, hence the value of Radiostol—*the original British irradiated ergosterol*—when it is administered:—

(1) to the mother during pregnancy and lactation

(2) to the child as soon as it is fed independently of the mother

Radiostol therapy ensures the ingestion of Vitamin D in accurately-standardised amounts. Radiostol, being non-toxic, possesses the further advantage of producing no ill-effects even when administered in doses greatly exceeding the normal daily requirement of Vitamin D.

RADIOSTOL

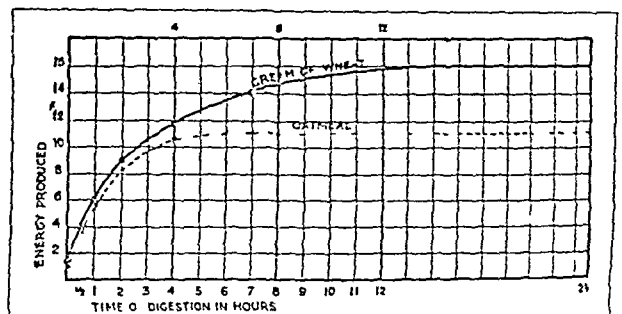
IMPORTANCE of STARCHY FOODS in INFANT DIET

Tests by a great biochemical institute prove this wheat cereal invaluable as first solid food

LEADING practitioners to-day are agreed that it is vitally important to introduce a *starchy* food into the diet of infants at a very early stage



In a recent article on Starch Feeding (*The Practitioner*, July, 1930) a leading paediatrist stated

> The addition of starch to an infant diet allows carbohydrate digestion to take place more slowly and there is less tendency for fermentative diarrhoea to occur
>
> Instead of the blood stream being suddenly flooded with carbohydrate, and its absorption being extremely rapid, such starch must first undergo hydrolysis, and is then absorbed over a period lasting almost until the next feed
>
> Starch is a useful addition to sugar to metabolize the fat in an infant's diet, and the presence of a colloidal solution of starch (cooked) retards curd formation, and therefore adds to the digestibility of milk

This authority has placed "Cream of Wheat" on his diet sheets, as a first solid food for infants

Greater digestibility—50%, *higher sugar yield*

Long successful as an infant diet, this wheat cereal has recently been tested exhaustively by one of the leading

It will be seen that after 4 hours the digestion of oatmeal was practically at a standstill while that of "Cream of Wheat" continued at a scarcely diminished rate for a further 4 hours. When digestion was complete, the sugar from "Cream of Wheat" was nearly half as much again as that from oatmeal — making it productive of 1½ times as much energy

biochemical institutes of Great Britain. Comparison of "Cream of Wheat" with oatmeal proved not only that the former is more digestible, but that in its absorption—a process continuing twice as long as that of oatmeal—it yields 1½ times as much sugar and thus of energy

"Cream of Wheat" is an extremely palatable product made from the kernel of the best hard wheat. It contains 72% starch, and is free from any harsh parts which might irritate the intestinal tract. It is therefore invaluable, not only as an infant's food, but for patients during the post-operative period and convalescence. If you would care to examine the product we shall be delighted to supply you gratis with a sample and a detailed account of the tests. Please enclose your professional card to Dept. W.8. Fassett & Johnson Ltd., 86, Clerkenwell Road, London, E.C.1

Local Anæsthesia in Surgical Practice

REDUCTION OF FRACTURE.

Typical Case.

A. B. D., aged 28 years.

Diagnosis: Fracture of lower third of the left radius.

Anaesthesia: Brachial anaesthesia; 5 c.c. of 2 per cent. Novocain solution were used and anaesthesia was complete in five minutes.

Operation: Relaxation was perfect, the fracture reduced, and moulded splints applied without pain to the patient.

—EXTRACT from PRACTICAL LOCAL ANAESTHESIA (Farr).

(Full technique of this and one hundred other operations under Local Anaesthesia will be found in the above work, published by Henry Kimpton, 263, High Holborn, London, W.C 1.)

THE SAFEST LOCAL ANAESTHETIC.

Ample supplies of Novocain are available for the use of Surgeons at all the chief Hospitals. Specify "Novocain" for your next operation.

Does not contain Cocaine, and does not come under the Dangerous Drugs Act.

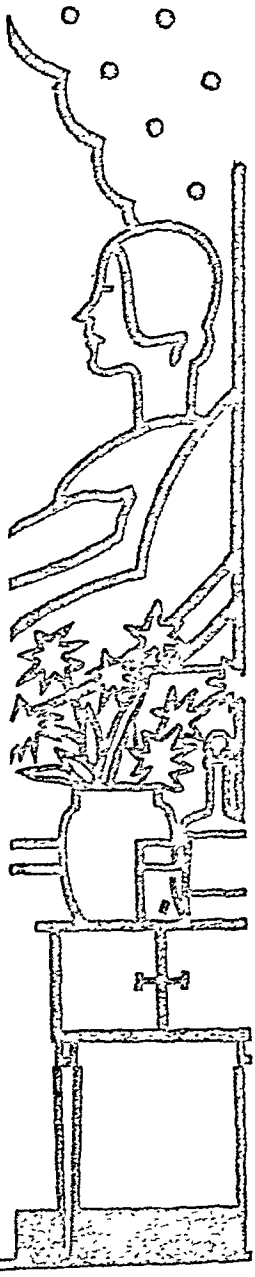
now you can give up saying "Give up coffee"

There was a time when the physician said "Give up coffee" and fervently prayed that the patient would have sufficient will-power to resist the tempting flavour and aroma of "the beloved beverage."



To-day the physician says "Give up caffein—drink H.A.G. Coffee." For H.A.G. Coffee is genuine, delicious coffee with the effects of caffein minimized. H.A.G. Coffee has two virtues that endear it to the medical profession. It can be enjoyed without danger of caffein effect. And it is so rich and satisfying in flavour that the patient is no longer tempted to drink caffein-containing coffee.

A blend of the world's finest coffees

H.A.G. Coffee is real coffee—a superior blend of the choicest Central and South American coffees. The decaffeination process takes place *before* the coffee beans are roasted. This leaves intact all the mellow flavour and fragrance that have made coffee the world's favourite beverage. Coffee experts recognize that no other blend is finer.

H.A.G. Coffee is under the independent control of The Institute of Hygiene and British Analytical Control.

Your grocer stocks H.A.G. Coffee—ground or in the bean and in vacuum tins that preserve its freshness and its fragrance. Or send the coupon below for a liberal sample tin of H.A.G. coffee. With it we shall be pleased to send some literature upon the action of Caffein. Send the coupon now.

MAP SHOWING THE KINGDOMS FOUNDED IN BRITAIN BY THE TEUTONS IN THE FIFTH AND SIXTH CENTURIES.—The Angles migrated to Britain from the coasts and islands of the Baltic. The Saxons appeared to have been settled west of them, on the North Sea coast. English history only becomes reliable with the arrival of St. Augustine—A.D. 597. Before this date we learn vaguely—from the Anglo-Saxon Chronicle, of doubtful reliability—that Ælle founded the kingdom of Sussex several centuries later. Ælle, through success in war, became Bretwalda or paramount sovereign of the South Saxons. We hear later of a terrible defeat inflicted upon the West Saxons by the Britons at Mount Badon, the locality of which is quite uncertain, "where they made no small slaughter of those enemies about 44 years after their arrival in England." The northernmost kingdom founded by the Teutons was Bernicia, with Bamborough as its chief centre. Ida seems to have been the pioneer spirit in this settlement between the Forth and Tees in 547. Deira arose in 560. In 588 these two kingdoms were united to form Northumbria—later to become celebrated as one of the first spiritual and intellectual centres of the evolving western world. Mercia eventually absorbed Lindsey, Hivicce, Middle Anglia and parts of Essex and Wessex. At the end of the sixth century, Kent was the foremost Teutonic kingdom, its sovereign exercising a hegemony over the other kings south of the Humber.

THE RELIEF OF TOXIC HEADACHES

In addition to those headaches directly traceable to some ocular, nasal, aural, dental or circulatory lesion, there are even more cases in which no structural or functional abnormality is apparent. Of these, a very large number are due to blood toxicity. Such poisoning is not necessarily bacterial in origin, being more frequently due to the retention of waste or perverted products of metabolism that should have been promptly eliminated.

Many people suffering from this sort of headache obtain great relief from a morning draught of Eno's "Fruit Salt" which, by promoting intestinal peristalsis, eases the traffic congestion throughout the body. It is not suggested that headache is often directly caused by the absorption of bacterial toxins from the alimentary canal, for evidence as to such absorption is inconclusive; but the fact that relief so promptly follows the emptying of the lower bowel suggests that a hold-up at any part of the body's physiological sequence tends to slow down the whole.

Eno's "Fruit Salt," it may be mentioned, contains no trace of sulphate of soda or of magnesia. It is refreshing and agreeable to the palate, although no sweetening or flavouring agent is added.

ENO'S "FRUIT SALT"

"Urgent Abdominal Diagnostics"

The Proprietors of ENO'S "Fruit Salt" will deem it a privilege to send to any member of the Medical Profession a copy of the latest of their series of "Medical Reminders"—with or without a bottle of their preparation as desired. "Urgent Abdominal Diagnostics" summarises the salient facts which need to be ever at the front of the mind when faced with an abdominal emergency. The diseased conditions dealt with include those which most often call for immediate surgical attention. It is bound in black morocco limp to conform to the style of the previous publications in this series.

Observations
ON

CEREBRAL HAEMORRHAGE DUE TO CAUSES OTHER THAN ARTERIOSCLEROSIS*

BY

JAMES COLLIER, M.D., F.R.C.P.

CONSULTING PHYSICIAN AND EMERITUS LECTURER ON NEUROLOGY, ST. GEORGE'S HOSPITAL

The subject of cerebral haemorrhage due to causes other than arteriosclerosis, which I am introducing for your discussion, has caused very much interest and investigation, and our knowledge of its causation and successful treatment has been greatly increased during recent years, chiefly owing to Quincke's "lumbar puncture" and its almost universal use in the treatment of patients who present a picture of meningitis, of coma, of apoplexy or even of unexplained headache, and in the routine examination of the cerebro-spinal fluid in cases of disease of the nervous system. The result has been that at the moment a whole series of clinical states are well known to result from cerebral haemorrhage, some of which closely resemble meningitis, lethargic encephalitis, uraemia, diabetic coma, migraine and even simple headache with or without pyrexia, while others present as curious recurring and rapidly transient attacks of unconsciousness, hemiplegia, aphasia, or any combination of these. Some are dominated by the involvement of one or more cranial nerves, while the variety which is called haemorrhagic pachymeningitis seems to have a peculiar syndrome of its own which we are only just beginning to recognize.

Practically none of these features are mentioned in the descriptions of cerebral haemorrhage of twenty years ago and they are only now coming slowly into our modern textbooks of medicine. I take it that the arteriosclerosis which we are excluding from this discussion will comprise atherosclerosis, the mesial arterial degeneration of high blood pressure, syphilitic arteritis, and the calcareous arteritis of diabetes. It is remarkable that these common causes of cerebral haemorrhage hardly come into causal relation with the conditions we are to discuss to-day, with the exception of atherosclerosis. So that we have new pathological findings and ideas for the new clinical manifestations.

CAUSES OF CEREBRAL HAEMORRHAGE

The following list comprises the definitely known and the hypothetical causes of cerebral haemorrhage:

Injury during birth, or following trivial concussion—haemorrhagic pachymeningitis; oozing from blood vessels; increased permeability of walls; diapedesis; encephalitis; poliomyelitis; *lethargic encephalitis; tuberculous meningitis;* sinus thrombosis; venous bleeding; abnormal blood states; leukaemia; purpura; anthrax infection; insolation; neoplasms, from the rupture of poorly developed vessels in a soft growth; aneurysm—infective in ulcerative endocarditis, puerperal infection, gonorrhoea, etc., and occurring in coarctation of the aorta and also in polyarteritis acuta nodosa of Kussmaul and Dickson; the berry-like and often multiple aneurysms which have been termed congenital aneurysms. (Syphilitic aneurysms of the cerebral vessels seem not to give rise to haemorrhage, but berry-like aneurysms leading to haemorrhage are not uncommon in atherosclerosis.)

Haemorrhage, both meningeal and intracerebral, from the moulding of the head in parturition, seems to be an event of common occurrence. Many years ago Mraczek examined a very large number of infants stillborn or dying within three months of birth, and found that some haemorrhage had occurred in one-fifth of all the cases. In its minor degrees this haemorrhage seems easily recovered from. When severe it may be the cause of still-birth and of convulsions occurring soon after birth, but it is certainly never a cause of cerebral diplegia. The oozing of blood from vessels due to increased permeability of the walls which has been put forward by Osler and many others to account for slowly oncoming subarachnoid and subdural haemorrhage, is a pathology which will have little appeal to those of us who know well how slowly blood may escape from a leaking aneurysm, and how minute and difficult to find such aneurysms may be.

Encephalitis

Encephalitis is important in connexion with our subject. Poliomyelitis, though characteristically a microscopically haemorrhagic disease, does not seem often to cause major haemorrhage, either meningeal or cerebral. It is likely that the "plum pudding" brains with multiple large lacunar haemorrhages which were formerly claimed for this form of encephalitis would not pass the present-day histological tests. Lethargic encephalitis is of great interest in connexion with our subject, for from the early years of the nineteenth century onwards very many cases of subdural, subarachnoid, and cerebral haemorrhage from ruptured aneurysm have been recorded in which the clinical picture was hardly distinguishable from that of lethargic encephalitis. On the other hand many cases which have been proved histologically to be examples of this disease have been complicated by subarachnoid and cerebral haemorrhage. The only means of correct diagnosis is the histological test for lethargic encephalitis, or the discovery of another definite cause for the haemorrhage. I have myself made a mistake in the diagnosis of these conditions, for during the epidemic of 1919 a case came under my observation which from the influenza-like onset, the pyrexia, diplopia, rousable coma, and normal cerebro-spinal fluid seemed typical of lethargic encephalitis. At the necropsy I found an aneurysm of the posterior communicating artery which had become adherent at the edge of the left middle fossa and had caused a very large subdural haemorrhage filling the middle fossa as with a mould of currant jelly. The cerebro-spinal fluid was not even stained at the time of necropsy.

Neoplasms

Neoplasms of soft texture are important causes of cerebral haemorrhage, for such a growth may bring on a haemorrhage before the appearance of any local or general signs, and I have several times seen a fatal apoplexy in a young subject resulting from a haemorrhage into an otherwise symptomless glioma. We should bear in mind too that minor haemorrhages are of common occurrence in the substance of cerebral tumours and may produce a rapid increase in the severity of the symptoms.

Cerebral Aneurysm

Aneurysm of the cerebral arteries is at the present time attracting much attention as a very common cause of every variety of intracranial haemorrhage and as giving rise to the most varied clinical syndromes. Such aneurysms are held to be of common occurrence, and often give rise to no trouble during life, for at least one-fifth of the numerous specimens in our museums have been chance discoveries at necropsy; some of these have been very large aneurysms. They are never of syphilitic origin. The etiology of a minority is well known in the bacterial infections of the blood of infective endocarditis, of gonococcal, and of puerperal infections. In coarctation

* Made in opening a discussion in the Section of Neurology and Psychological Medicine at the Annual Meeting of the British Medical Association, Eastbourne, 1931.

of the aorta, where the arterial tension above the constricted area in the aorta becomes extremely high when adult life is reached, the tunica media splits locally under the pressure with the formation of aneurysms which are often multiple. They are a feature of the curious malady first described by Kussmaul—"polyarteritis acuta nodosa"; and, further, they may occur in atherosclerosis.

But the cause of the majority of the cerebral aneurysms has not yet been determined with any certainty. Eppinger, from the absence of signs of any inflammatory process in the aneurysms and the negative etiology, termed them congenital aneurysms, implying that they were due to a local congenital defect in the arterial wall which at any time during life might bulge under the strain of the blood pressure with subsequent aneurysm formation. This view has been taken by Froin and by many others. Harvey found an aneurysm in a rabbit 14 days old; Turnbull recorded one in a child of 19 months; and they have been repeatedly found in children, though they do not as a rule give rise to symptoms until after puberty.

Murray Drennan found that these aneurysms often occurred at the branching of vessels and believed that a rupture of the muscular and elastic coats occurred at the acute angles formed by the union of cerebral vessels. He suggested that the eddy of the blood stream at such points might allow organisms to settle down in these regions especially, and so cause aneurysm. Wiley Forbus has recently shown that the muscular and elastic coats are normally absent at the angles of junction of all the smaller arteries; and, while he supports the theory of a natural weak spot at these sites, he necessarily invokes some other unknown factor which determines the appearance of an aneurysm only in some subjects and in a few places, although the "congenital fault" is common to all arteries and to all people.

I have called these aneurysms "berry" aneurysms because of their shining coats and rounded outlines; they hang like berries on the arterial stalks and are often multiple. I think that it is highly probable that many of them are really of infective origin from some low-grade blood infection which is otherwise symptomless. They are similar in location and appearance to the infective aneurysms, and like them are also found on the splenic, mesenteric, and other arteries of the body. There is yet another suggestion—namely, that the so-called congenital aneurysms may be caused by a local form of atheroma occurring in young subjects which often heals leaving linear scars upon the vessels. It is an interesting point that berry aneurysms have appeared in more than one member of the same family. Gowers records an example in two brothers, and Dr. Greenfield has met with two other instances.

SYMPTOMATOLOGY

Aneurysms seem to give rise to no symptoms at all, however large they may be, unless they clot up, calcify, become adherent to surrounding structures—generally some of the cranial nerves—or unless they burst. They may rupture frankly in any situation within or upon the brain, and then, whatever the position, they produce the syndrome of a severe rapidly fatal apoplexy with blood in the cerebro-spinal fluid. When the haemorrhage is less rapid and the aneurysm is buried in the brain substance, or has become adherent and bursts into it, the resulting picture is in no way distinguishable from that produced by cerebral haemorrhage from other causes. But these aneurysms have a tendency to rupture slightly and to leak slowly, after which they often heal, to leak again later on—often in another situation. They may leak into the subdural space and there form an organizing haematoma, liver-like in appearance and with a clinical picture, sometimes closely resembling lethargic encephalitis, and at other times peculiar to this condition, as Dr. Martin will describe to us later. There is no blood staining of the cerebro-spinal fluid in this type.

They often leak into the subarachnoid space and then most commonly produce a syndrome precisely resembling meningitis, with headache, pyrexia, head retraction and stiff neck, and frequently with diplopia, vomiting, and convulsion: the distinction from meningitis is the presence of blood in the cerebro-spinal fluid and the relief produced by draining. There is one modification of this syndrome to which I wish especially to call your attention, and that is when no other signs of meningitis, except the headache alone, are present.

A lady who was touring in the country developed so severe a headache that she decided to return home, and drove her car from Liverpool to London without a break. I saw her immediately after arrival and could not determine the cause of her complaint; and though I had my needles with me and discussed the question of lumbar puncture with her husband, who was a doctor, I decided that there was no indication for it because she had no physical signs whatsoever except the headache. Some eight hours later and without the development of any further signs or symptoms she dropped dead when walking round her room. A lumbar puncture made after death showed copious blood under high pressure in the subarachnoid space.

The transient phenomena which may follow upon a not too rapid and not too copious haemorrhage upon or within the brain are very remarkable; some of them are difficult of explanation and all are likely to give difficulty in diagnosis, as they may occur without headache or signs of meningeal irritation. The more common of these transient signs are attacks of unconsciousness lasting from a few hours to many days, of headache resembling migraine, of hemiplegia, of aphasia, of convulsions local or general, of delirium with headache, of pyrexia with headache, of headache or of unconsciousness with albuminuria or with glycosuria of high concentration. I have myself seen all of these events, and doubtless there are many others. Here is a very good example:

A commercial traveller aged 30 suddenly fell unconscious at his work in a shop at Leeds and is said to have remained unconscious for sixteen days. A lumbar puncture revealed copious blood in the cerebro-spinal fluid. Thereafter he recovered rapidly and resumed work. A few months later he again fell unconscious for a short time, and on recovering was convulsed in the right hand and vomited. He showed marked slurring of speech and an extensor response on the right side. A lumbar puncture again revealed copious blood. He recovered in four days and returned to work. Two months later he was suddenly seized with mental confusion, weakness on the right side and aphasia. Blood was again found in the cerebro-spinal fluid and he once more made a rapid and complete recovery. Some time later he had sudden severe headache followed by delirium and convulsion; he recovered in a few days. Some weeks after this he came into the National Hospital under my care where I could find nothing abnormal about him except the bright yellow cerebro-spinal fluid.

Very many cases of this order have been reported, and notably one by the late Dr. Fearnsides in which a series of severe but rapidly transient cerebral events including unconsciousness, convulsion, hemiplegia, and aphasia occurred one after the other. Each lasted but a day or two, and between these events the patient carried on with work. Eventually a third nerve paralysis from adherence of an aneurysm led to admission into hospital, where the frank rupture of an aneurysm into the cerebral hemisphere proved immediately fatal. Previously to the final haemorrhage there had been only slow leaking of blood into the subarachnoid space which must have caused the varied and isolated transient symptoms.

The lethargic picture so closely resembling that of lethargic encephalitis has been associated with slow cerebral haemorrhage ever since it was first reported in 1824 in connexion with a leaking aneurysm I have seen it in subdural haemorrhage, in subarachnoid haemorrhage, and in slow intracerebral haemorrhage where there has been much ploughing up of the convolutions at the base of the brain The distinction between these two conditions during life may be exceedingly difficult

Delirium, convulsion, pyrexia, albuminuria, glycosuria, and the retinal haemorrhages (both subhyaloid and flame shaped) give wide scope for discussion of their cerebral origin Delirium and convulsion may be the result of the extravasation of blood on the surface of the brain both may occur when there is no gross lesion of the brain Pyrexia albuminuria, and glycosuria suggest interference with that thin slice of the mid brain which is known to be concerned with heat regulation, and with that region of the medulla in which the punctures of Claude Bernard produced albuminuria and glycosuria, but this cannot be the explanation, for I have seen all of these events in cases where these parts were entirely free even from surface haemorrhage The flame shaped haemorrhages and the papilloedema are obviously due to the increased intracranial pressure, and the subhyaloid haemorrhages must have a like origin in a very rapidly rising intracranial pressure The latter cannot be due to the direct seepage of blood from the subarachnoid space into the retina, as has been maintained, for I have seen them when there has been no subarachnoid haemorrhage and again when the subarachnoid or the primary ventricular haemorrhage has never reached the anterior aspect of the base

SITES OF RUPTURE OF ANEURYSM

My especial interest in cerebral aneurysm urges me to put before you a short list of the situations in which an aneurysm may burst or leak I have seen examples of the following

(1) Tran dural Rupture the case observed was one of aneurysm of the left posterior communicating artery in a young woman It became adherent to the dura and ruptured into the outer wall of the cavernous sinus producing great pain and loss of sensibility in the distribution of the first and second divisions of the fifth nerve and paralysis of the third fourth and sixth nerves The pool of blood thus formed in the middle fossa of the skull ruptured later on into the subarachnoid space with immediately fatal results (2) Subdural rupture (3) Subarachnoid rupture (4) Intracerebral rupture (a) from a surface aneurysm which becomes adherent to the brain tissue (b) from an aneurysm buried in the brain tissue (5) Primary rupture into the ventricle In this condition the wall of the aneurysm encroaches upon the wall of the ventricle and ruptures thereinto with little or no tearing of cerebral tissue The interesting clinical aspect of this rupture when it is not too rapid exactly, resembles that of the much more common subarachnoid haemorrhage (6) Rupture of an internal carotid aneurysm into the cavernous sinus The clinical picture is that of a unilateral pulsating exophthalmos

In those aneurysms which rupture slowly and leak rather than burst there is a great tendency for the rupture to heal locally and for another to occur later in another part of the sac—perhaps after this has become adherent to surrounding structure, especially the brain substance

This is the common explanation of subarachnoid haemorrhages repeated at considerable intervals of time and followed not infrequently by a fatal rupture into the brain substance Many of the aneurysms never rupture nor give rise to any symptoms, and many which leak heal permanently and become obsolete Though we are discussing cerebral haemorrhage it is necessary for me to point out that when an aneurysm clots up in part or when its wall calcifies, then and then only does it give rise to local pressure symptoms And it does so most commonly in the region of the optic chiasma causing a syndrome indistinguishable from that of a pituitary tumour Such a picture followed by sign of cerebral haemorrhage can be due to nothing else but aneurysm Another common clinical antecedent to the leaking or rupture of an aneurysm of the posterior communicating artery is adherence of the aneurysm to the third or the sixth nerve, causing paralysis of these nerves

The treatment of subarachnoid haemorrhage where the escape of blood into the thecal space is free is an interesting matter for discussion, since it has been held that repeated draining away of the effused blood by lumbar puncture increases the tendency to bleeding though it undoubtedly relieves the symptoms greatly for the time being My own practice is always to drain freely and repeatedly so long as the symptoms of increased intracranial pressure persist and I have never had cause to regret this practice The cases that you cannot drain generally die and these are the cases where an extensive subarachnoid effusion of the convexity clots at its edges and so prevents the escape of the blood into the general subarachnoid reservoir while the collection constantly increases at its centre Such cases usually end with extension of the blood sac into the cerebral substance—the meningo cerebral haemorrhage of From Other undrainable cases are those in which the haemorrhage is largely or altogether subdural The cause of death in cases of cerebral haemorrhage is always the increase of intracranial pressure and surely it is wise to keep this within bounds by draining whenever it is possible to do so

ACUTE TONSILLITIS AND SOME OF ITS SEQUELS:

EPIDEMIOLOGICAL AND BACTERIOLOGICAL OBSERVATIONS*

BY

J ALISON GLOVER O B E, M D, M R C P, D P H

AND

FRED GRIFFITH, M B, D.P H

MEDICAL OFFICERS OF THE MINISTRY OF HEALTH

In the following paper tonsillitis is considered as the local *manifestation* of infection with haemolytic streptococci The subsequent course of this infection is dependent on two factors, the pathogenic quantities of the infecting strain and the state of immunity of the individual attacked The size of the infecting dose is a contributory factor, it is difficult to estimate, but is probably proportional to the level of infection in the community and to conditions, such as overcrowding, which favour transmission

We have described scarlatina as one of the sequels of this *form* of tonsillitis This is a convenient way of differentiating the two clinical conditions, acute tonsillitis and scarlatina, which apart from the presence of a rash and the greater risk of nephritis in the latter appear to us to be almost identical, both epidemiologically and bacteriologically The data which we put forward have been largely derived from inquiries into outbreaks at school and we are greatly indebted to the school medical officers who have assisted by supplying us with material and statistical information We are unable to give their names owing to the confidential nature of these inquiries made in outbreaks in which the help of the Ministry of Health had been sought by the school authorities and

others conducted under the aegis of the Committee of the Medical Research Council for the investigation of epidemics in schools. We wish to thank the Council and the Committee for permission to use their records for this purpose, and the secretary of the Committee, Dr. Joyce Wilson, for her valuable help.

CLINICAL FEATURES OF TONSILLITIS

Tonsillitis is an endemic and epidemic infectious disease with an incubation period which ranges as a rule from two to four days. It is uncommon at ages below five and above forty years, and its greatest incidence is about the age of puberty; adults, however, often suffer severely in epidemics associated with infected milk. Infection is conveyed in three principal ways: (1) by milk or cream, (2) by such vehicles as tableware, pencils, handkerchiefs, and possibly by impure swimming-bath water, and (3) by droplet infection. The first method, transmission by milk, has resulted in many severe outbreaks in different parts of the world, but in most of the epidemics in schools, with which this paper deals, milk can be definitely excluded as a source of infection.

Tonsillitis is an important cause of sickness in all the three fighting services,*[2] and as an endemic disease its diapason runs through all out-patient, school and industrial invalidity statistics. Close[4] records that out of 382,272 patients attending the Casualty Department at Guy's Hospital for the first time for all disorders, 25,629 (6.7 per cent.) were suffering from acute tonsillitis. Dudley[7] found that the average attack rate per term of tonsillitis at the Royal Naval School was 4.6 per cent. Reports to the committee of investigation into epidemics in schools show that just under 4 per cent. was the average term attack rate among 8,500 boys in great public boarding schools during 1930, a particularly healthy year; in the same year 3,000 girls in well-to-do boarding schools had an attack rate of 4 per cent. per term. But in epidemics the attack rate may be ten times as high. Haig-Brown,[12] for example, in 1886 recorded an attack rate of 63 per cent. in one autumn term in one house of Charterhouse School, 34 out of 54 boys being attacked, though the housemaster, his family, and 11 servants all escaped. We shall see that an attack rate of from twenty to thirty per cent. in one term is by no means uncommon.

The organism most commonly associated with inflammatory conditions of the throat, apart from diphtheria, is the haemolytic streptococcus or *Streptococcus pyogenes*, and there is strong evidence that it is the active pathogenic agent. The haemolytic streptococcus is also found in the throats of a proportion of healthy persons, its incidence varying with the locality, the season, and the hygienic circumstances of the community examined. Topley[22] showed the monthly percentages of healthy persons, living under different housing conditions in Manchester in 1925-26, who were carrying haemolytic streptococci. The incidence ranged from 36 per cent. in November, 1925, corresponding with a period of high incidence of scarlet fever in the city, to zero in October, 1926. Topley and Wilson[23a] say:

> "Our knowledge of the carrier-rate of *Streptococcus haemolyticus* among various samples of the population is as yet far less extensive than in the case of the diphtheria bacillus, though it seems fairly certain that the average rate is higher in the former case than in the latter."

In plate cultures of throat swabs taken from patients with acute tonsillitis, haemolytic streptococci are almost invariably found in profuse or even in pure culture. In the earliest stages of scarlet fever they can be grown from throat swabs in from 90 to 100 per cent. of cases. They often multiply in the throat in measles, and are obtained from the ear discharge in at least 75 per cent. of cases of otitis media. Moreover, it will be shown that some of the common ailments among schoolboys, such as febricula, feverish cold, nasopharyngeal catarrh, and influenza, especially when these occur during outbreaks of tonsillitis or scarlet fever, are associated with the presence of haemolytic streptococci in the throat, although the sore-throat symptom is often absent.

SEQUELS OF TONSILLITIS

Following upon tonsillitis due to infection with haemolytic streptococci there are three sequels of major importance. These are scarlet fever, otitis media, and acute rheumatism. Other diseases in schools which appear to have some relationship to tonsillitis are epidemic catarrhal jaundice[10] and appendicitis, but it is not possible to discuss these in this paper. To refer to scarlet fever as a sequel of tonsillitis has a justification beyond the mere sequence in time expressed in Trousseau's phrase: "Sore throat is an essential part of scarlet fever; it precedes the eruption." From the epidemiological standpoint, too, scarlatina may be regarded to some extent as a sequel of tonsillitis, though perhaps it would be more correct to say that the occurrence of scarlatinal cases in a community is often a consequence of a high level of infection, that is, as shown by a high carrier-rate, of haemolytic streptococcus. The first clinical indication of this high level of infection is the occurrence of cases of tonsillitis which often precede the appearance of typical scarlet fever cases. The above considerations are applicable in particular to those outbreaks of scarlet fever in which the incidence of the disease is of a more or less sporadic nature; that is to say, when single cases occur at intervals of a week or more. On the other hand, there are instances where the introduction of scarlatinal infection into a school or other institution results in an explosive outbreak. The distinction between these two varieties of scarlatinal outbreaks will be discussed later; in the main it depends, we believe, upon the type of streptococcus concerned as determined by serological methods.

CARRIER-RATE

While observations upon the carrier-rate of the haemolytic streptococcus in non-epidemic times are unfortunately very few, there is ample evidence that if a sample swabbing be taken of a community in which cases of scarlet fever are occurring, a high carrier-rate of haemolytic streptococcus will generally be found. In five consecutive instances where such sample swabbings were made in schools and school-houses in which cases of scarlet fever were occurring, the carrier-rates of haemolytic streptococcus found were 33, 26, 26, 36 and 33 per cent. respectively. On the other hand, carrier-rates of this height may be encountered without the occurrence of cases of scarlet fever. Thus, one of us (F. G.) found a carrier-rate of 27 per cent. in a large sample from a public school during a healthy Christmas term in which no cases of scarlet fever occurred. There had been much tonsillitis in previous terms at this school, but a notable absence of scarlet fever. Only three of the 26 strains of haemolytic streptococci were identified with one or other of the four chief scarlatinal types, a result which is consistent with the absence of scarlet fever in the school.

It has been known for many years that cases of tonsillitis without rash ("scarlatina sine eruptione") occur during epidemics of scarlatina side by side with cases in which a fully developed rash appears; and in 1887 Mantle[16] pointed out that epidemics of sore throat were closely allied to those of scarlatina. Moreover, as mentioned above, it appears that other forms of pharyngitis

* Annual admission rates per cent.: Navy average 1924-28, 3; Army (Home) 1929, 4; R.A.F. (Home), 4.2.

and febricula besides tonsillitis may be due to infection with haemolytic streptococci; these conditions may occur side by side with cases of scarlet fever as alternative clinical results of the same infection. In addition, we must recognize the existence of many entirely symptomless carriers.

"It is almost certain that scarlet fever must be placed in the category of infections in which the ratio of carriers to typical cases is high." (Topley and Wilson.[23b])

The existence of carriers, as Parsons[25] has pointed out, makes the preventive control of scarlet fever a very difficult matter.

BACTERIOLOGY OF SCARLET FEVER

Bacteriological observations have provided confirmation of the view that scarlet fever is one of the manifestations of infection with haemolytic streptococci, and that certain types of these are specially equipped to set up the complete scarlatinal syndrome. Of the strains derived from 375 cases of scarlet fever admitted during the four years 1926-29 to Park Hospital,[11] 68 per cent. fell into one or other of four types (Type 1, 10 per cent.; Type 2, 25 per cent.; Type 3, 22 per cent.; Type 4, 11 per cent.); the remaining 32 per cent. were markedly heterogeneous in their serological relationships. Since four types are accountable for the majority of scarlatinal cases, it might be assumed that the toxigenic capacities of these "chief" types are sufficiently high to override the antitoxic immunity of a considerable proportion of a population exposed to infection. On the other hand, the inability of certain strains to produce more than isolated cases would seem to indicate that in the same population there were relatively few individuals whose antitoxic immunity was so low that infection with these types, which form a heterogeneous group, resulted in the development of a scarlatinal rash.

To support the theory of a superior toxigenic power inherent in the "chief" types compared with that of the heterogeneous types may be cited the following contrasts between two schools of boys, 9-14 years of age, both of which had been free from scarlet fever for a long time.

A is a separate preparatory school of 52 boys,[9] and B with 66 boys is the junior house of a large public school. In each case, the infection was introduced in the Christmas term,[11] and was carried on to the next (Lent) term by return cases; in A the infecting haemolytic streptococcus was Type 2 (scarlatinal), the most frequent of the "chief" types, whilst in B the infecting strain belonged to the heterogeneous group. In the preceding Christmas term A had 7 boys out of 52 attacked by scarlet fever, two boys had tonsillitis, and seven pyrexia; similarly, B had one certain case of scarlet fever and two doubtful cases, but no information as to tonsillitis and pyrexia cases in B is available for the preceding Christmas term. In this term there were 8 cases in the other houses of the big school of which B was the junior house, but in the next (Lent) term, scarlet fever cases occurred only in B. Fig. 1 contrasts the incidence of the three diseases in each school in the Lent term. In the Lent term the cases began 5 days after the beginning of term at B and 11 days after at A. A had 21 cases of scarlet fever (out of 42 boys unprotected by previous attack), 11 cases of tonsillitis, 7 of pyrexia. The carrier-rate of haemolytic streptococci in boys in school on March 14th was 26 per cent. In the corresponding term B had 5 cases of scarlet fever together with one patient who peeled subsequently, one case of tonsillitis and 32 cases of pyrexia. On March 5th the carrier-rate of haemolytic streptococci of boys in B (apart from scarlet fever patients but including the boys who had had pyrexia) was 30 per cent. It seems possible that their pyrexia had been due rather to streptococcal nasopharyngitis than to influenza. At A the disease was carried on by a chronic carrier (immune by attack in infancy but reinfected in the Lent term as regards the throat) into the summer term, when 4 cases of scarlet fever, 3 of tonsillitis and 6 cases of pyrexia occurred. In addition, the Type 2 infection at A caused at least 8 return cases of scarlatina, whereas with the exception of the carry over from the Christmas to the Lent term, no return cases were known to have occurred with the heterogeneous strain infection at B, though during the same 6 weeks strict hospital isolation was enforced at both schools.

Thus, the Type 2 streptococcus seems definitely more infective, and far more toxigenic, while its tendency to persist is shown by the fact that some of the patients yielded Type 2 positive swabs for long periods (in one case 155 days). This contrast certainly supports the view that the toxigenic power of a haemolytic streptococcus, as shown by its ability to produce a scarlatinal rash, is linked up with its serological type characters. On the other hand, as the following experience shows, one of the chief scarlatinal types, in this instance Type 1, may cause an extensive outbreak of disease without producing definite scarlatina. The details of the outbreak, which occurred in the Lent term, 1931, are as follows:

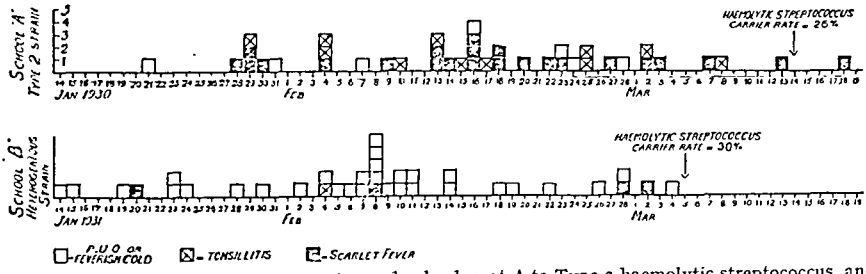

Fig. 1.—Contrast between outbreaks at two preparatory schools, due at A to Type 2 haemolytic streptococcus, and at school B to a haemolytic streptococcus of the heterogeneous group. A has 52 boys; B has 66 boys.

At a public school, C, of nearly 500 boys, for several years there had been severe outbreaks of tonsillitis shown to be caused by several of the heterogeneous types of haemolytic streptococci; in the Christmas term of 1929 a large sample swabbing of 96 boys showed a carrier-rate of haemolytic streptococcus of 27 per cent. In September, 1930, there was a case of pharyngitis in a member of the staff, a pantry maid, from whom a strain, subsequently identified as Type 1, was obtained; no cases of scarlet fever occurred during this term. The Lent term of 1931 began with 46 cases of feverish cold in the first five weeks, after which the clinical picture changed, and a severe epidemic of tonsillitis set in, 101 cases occurring, an attack rate for tonsillitis of 20 per cent., or, if the initial cases of feverish cold be included, of 30 per cent. Both the clinical types of disease gave rise to complications, especially adenitis and also otitis media (16 cases of the latter, including 3 mastoids). There were also 5 cases of sinusitis, one of pneumonia, and one death from septicaemia. The number of cases of otitis media is very significant in view of the type of streptococcus concerned in the epidemic. The proportion of cases of fully developed scarlet fever in which otitis media supervenes varies considerably in different epidemics, but 12 per cent.[11] seems to be the usual average. Thus, from 133 cases

of scarlet fever, 16 cases of otitis media might be expected. In the outbreak under consideration this number followed 101 cases of tonsillitis and 46 cases of pyrexia, pharyngitis, etc. After two months of epidemic prevalence there occurred almost simultaneously, though in four different houses, four cases (in one of which fatal septicaemia developed) of tonsillitis with rashes, but these rashes, though carefully considered, were not regarded as sufficiently characteristic to justify the diagnosis of scarlatina. It is of some interest that one of these four boys had a history of scarlet fever. There was no opportunity of examining bacteriologically all the cases of infection at this school and it is impossible to state definitely how many were due to the Type 1 strain, but swabs were sent at intervals during the term from cases both of tonsillitis and of feverish cold, and from most of these, Type 1 scarlatinal streptococci were isolated. It seems highly probable that much of the tonsillitis was due to Type 1 infection, and it is not unlikely that many of the initial 46 pharyngitis cases were of similar origin. Yet although this infecting strain produced one fatal case of what might be called *scarlatina maligna* and many cases with serious complications, it had in relation to this community hardly any toxigenic power. After the rapid transference inevitable in such a tonsillitis epidemic, it is likely that it became somewhat exalted in virulence and perhaps also in toxigenicity, since it was able to give rise to rashes in four cases, though these rashes were not typical of scarlet fever. Probably they resembled rashes which are described by J. D. Rolleston[9] as associated with tonsillitis.

Dick toxin than the younger boys of A, 9 to 14 years, highly "protected," and with but 4 per cent. with a history of previous scarlet fever. Moreover, the Type 1 from C does not appear to have produced return cases of scarlet fever elsewhere, whilst the Type 2 from A produced them in 23 per cent. of the cases. Although this particular Type 1 strain from C, whether owing to feeble toxigenicity or to the antitoxic immunity of the boys, failed to produce the scarlatinal syndrome usually associated with Type 1 infections, from the point of view of serious complications, with the possible exception of nephritis, there was nothing to choose between this epidemic and one of an equal number of cases of the ordinary mild scarlet fever of the present day. As regards nephritis, it may be mentioned that Gunn and Griffith[11] found this sequel most commonly in Type 2 infections, while Type 1 more frequently produced otitis media. The absence of rashes in this Type 1 infection was perhaps a misfortune. If this danger signal had been present in the earliest cases of the outbreak the period of isolation applicable to scarlatina would have been necessary and the spread of infection might have been checked. As it was, the patients were detained in the school sanatorium for an average period of perhaps a week, when they were allowed to return to school in some cases probably still in an infective condition.

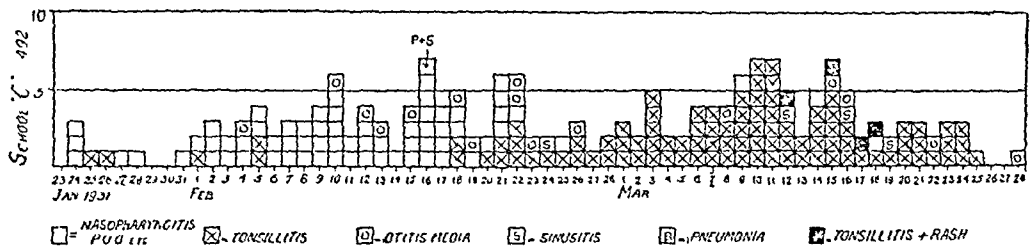

Fig. 2.—School C. Lent term, 1931. Population, 498 boys. Epidemic of tonsillitis due to Type 1 scarlatinal streptococcus. The daily incidence of sickness includes 46 cases of feverish cold, and 101 cases of tonsillitis are shown. Complications are shown including 16 cases of otitis media (3 mastoid operations), 4 of sinusitis, 1 of pneumonia and sinusitis, 1 of septicaemia (with rash). Four cases of tonsillitis with rash are included, but none was considered to be scarlatina.

The experience at this school raises two questions, neither of which on the information available can be answered. In the first place, do the strains of haemolytic streptococci commonly associated with scarlet fever, such as strains of Types 1 and 2, differ among themselves in their capacity to produce Dick toxin, while retaining their infective power and their distinctive serological type characters? (It may be remarked here that the other two types, Types 3 and 4, which have been frequently found in scarlatinal cases admitted to hospital, have not yet been identified in any school outbreak, and all our inferences have been derived from experience with Types 1 and 2.) Secondly, was this Type 1 strain fully toxic, the absence of rashes being attributable to an antitoxic immunity acquired by the school population as a result of the epidemics of tonsillitis in the previous terms? Since the Dick test was not applied there are no experimental data as to the antitoxic immunity of the boys, and it has not yet been possible to test the toxigenic capacity of any of these Type 1 strains in culture.

It seems difficult to avoid the inference that there must be wide differences between the toxigenicity of the Type 2 strain at A school and the Type 1 strain at C school,* even after due allowance has been made for the probability that the older population of C, ranging from 13½ to 18½ years, "salted" by previous epidemics of tonsillitis, and with 7.9 per cent. of its number with a history of scarlet fever, is more likely to have a high proportion of immunes to

A further question which may be considered in connexion with the outbreak at school C is whether antitoxic immunity, indicated by a negative Dick reaction, confers any protection against either local invasion of the throat or systemic infection by haemolytic streptococci. If it is assumed that the absence of scarlatinal rashes in the cases of tonsillitis which occurred at the school may be attributed to an antitoxic immunity acquired as a result of previous streptococcal infections, the answer to the above question would certainly be in the negative. Since, however, direct evidence as to the state of antitoxic immunity in the boys is not available it can only be said that such opinion would be in agreement with observations already recorded. (Kinloch *et alii*[10].) Further work on immunity to haemolytic streptococcus and its toxins is required, particularly in regard to the degree of protection conferred against the faucial and other manifestations of infection by the Dick method of active immunization.

Unfortunately, little work has been done on the Dick reactions of the pupils in our great boarding public schools, but it seems unlikely that the disproportion between the recent great prevalence of tonsillitis in these public schools, and the comparatively small incidence of scarlet fever, of a type which shows little tendency to spread, is due to a high percentage of Dick-negatives (immunes) in the schools. We have only had experience of one large-scale testing. Here 7 "dropping" cases of scarlet fever occurred in a school of 425 boys, 5 cases being in one dormitory. 338 boys (80 per cent.) were Dick-tested after the occurrence of the cases, and 64 per cent. of those tested were found

* This possibility is strengthened by the fact that toxigenicity tests showed the toxigenicity of this Type 1 strain to be very low.

Dick positive and only 36 per cent immune Of 22 boys who had had scarlet fever some years before, 6 (27 per cent) still gave positive reactions These are high proportions of positives compared with the experience of Zingher, who found 22 8 per cent Dick positive between 10 15 years and 16 8 per cent between 15 20 years, and Heller, who found 23 per cent positive between 14 19 years of age (Quoted by Topley and Wilson [3c])

An interesting example of an extensive epidemic, due to a single type of haemolytic streptococcus and continuing throughout two terms, occurred at school D In this school there had been an outbreak of tonsillitis in the previous Christmas term Throat swabs from 28 cases, including a nurse were examined during the Christmas term and all yielded abundant haemolytic streptococci Serological examination of the strains showed that 27 agglutinated with a serum prepared from one of them, only one strain, which gave a granular growth could not be identified serologically In the next term there was a recurrence of infections with haemolytic streptococci Many of these were diagnosed as influenza, but material from 31 cases, including tonsillitis (22), adenitis, otitis media, erythema nodosum, and one solitary scarlet fever, yielded profuse cultures of haemolytic streptococci Of these strains no fewer than 29 belonged to the same type of haemolytic streptococcus which was found in the previous term The culture from the case of scarlet fever could not be identified with the prevalent strain or with any one of the chief types In addition to the influenza and tonsillitis there had been a small epidemic of measles, which, no doubt, had helped to increase the carrier rate of haemolytic streptococci Unfortunately, no information is available as to the general carrier rate in this school

Bed charting of dormitories sometimes gives strong presumptive evidence that cases of so called influenza are in reality often due to haemolytic streptococci, as, for example when such cases occur at the same time as cases of tonsillitis and scarlet fever, and in adjacent beds

OTITIS MEDIA

Otitis media probably causes more anxiety to school doctors than any other disease (with the possible exception of appendicitis) It most often follows tonsillitis, influenza scarlet fever or measles, and at least three quarters of the cases in schools are due to haemolytic streptococci It is said (Yearsley quoted by Rolleston[17b]) that 29 per cent of acquired deafness is due to otitis after measles, and 34 per cent to otitis after scarlet fever, but in public schools tonsillitis appears to be a more frequent cause than either measles or scarlet fever Instances have been reported to us where the incidence of otitis media in an institution has assumed epidemic proportions It has been known to spread from patient to patient along one side of a school sanatorium ward, and in two instances 9 per cent of a school population has been attacked by it in one term

Gunn and Griffith[11] gave an interesting instance of bed to bed infection in a ward of a fever hospital Three children occupying adjacent beds developed otitis media within a few days of each other The first child to show a purulent discharge was suffering from scarlatina due to Type 1, this type was obtained subsequently from the ear discharges of the other two children It was inferred that the first child infected the other two, since it was shown that the latter on admission to hospital were infected not with Type 1 but with Types 2 and 4 respectively

In a mean population of 12,071, including 9 029 boys and 3,042 girls, in large public boarding schools, during four school terms (1930 31), 190 cases of otitis media occurred, 160 in boys and 30 in girls The seasonal variation is as follows —

	Lent 1930	Summer	Christmas	Lent 1931
Boys	40	26	11	83*
Girls	8	0	3	19

* Includes 20 cases in which acupuncture was performed for diagnostic purposes

The greater prevalence (roughly double) in the Lent term, 1931, compared with the Lent term, 1930, is associated in the case of the boys almost entirely with increase in tonsillitis, but in the case of the girls the increase is largely due to epidemics of measles in two schools The cases of otitis media occurring during the period of observation have been twice as numerous as the cases of scarlet fever, but there is an epidemiological similarity between these two sequels of tonsillitis since the highest incidence of both diseases coincides with the peak of the wave of tonsillitis Several interesting points emerge from a study of the statistical data

(1) The attack rate for the boys is considerably higher than for the girls

(2) By far the greatest incidence was in the winter terms In these there was no swimming thus one of the possible sources of infection—namely, the swimming bath—can be excluded

(3) The figures so far recorded show that previous tonsillectomy was without influence on the incidence of otitis media, out of 160 boys who suffered from otitis media 94 (58 8 per cent) had previously had their tonsils enucleated and their adenoids removed, of 30 girls, 16 (53 per cent) had been similarly treated prior to the onset of the otitis Moreover, of 23 boys who required mastoid operations, 14 (61 per cent), and of 13 girls, 8 (62 per cent) had previously had tonsillectomy

The above observations are in apparent agreement with those of Paton (1928),[17] who says The removal of adenoids results in an increased incidence of otorrhoea' and those of Bradley[3] who states There is ample evidence that tonsillectomy has not protected against otitis media' It must however, be pointed out that in half the cases some remnants are left and according to the opinion of the present day tonsillar remnants are more dangerous in providing a nidus of infection than the intact tonsil

There is no doubt that tonsillectomy in suitable cases greatly improves the general health, it is said also to increase the immunity to diphtheria, but it appears so far as our data go, to have little effect in diminishing the liability to other infections In view of the facts which we have established and their agreement with the records of other observers, it is at least doubtful whether there is justification for the operation of tonsillectomy on the scale shown by the records of the committee's investigation, which relate to the best nurtured portion of our youthful population They show that 49 per cent of the whole school population under review had undergone the operation Paton (1926)[17b] remarks, 'It is difficult to believe that there is justification for so widespread an attack upon a normal structure of the body

There was a very general prevalence of otitis media in schools in the Lent term of 1931 and the following outbreaks have furnished data of bacteriological and epidemiological interest

In F, a school of 463 girls where the attack rate for measles was 12 5 per cent the attack rate for tonsillitis was low—1 5 per cent for the term this low figure probably being an index of excellent hygienic conditions Material from 12 patients was examined and in 11 cases infection was found to be due to the same type of haemolytic streptococcus Type II in one of the types separated from the heterogeneous group Three of the swabs came from patients with otitis media (2 of during

as complications of measles), one from the throat of a patient with scarlet fever, six from patients with tonsillitis without rash, and the remaining two were specimens of sputum from patients with pneumonia complicating measles. This small outbreak illustrates the course of events which may result from the spread of infection in a community by one of the strains of the heterogeneous group. This group, as we have stated earlier, comprises a large number of types of haemolytic streptococci which, as contrasted with the four chief types, are rarely found in scarlatinal cases admitted to a fever hospital. Some at least of these heterogeneous types are highly infectious and set up the clinical conditions mentioned above, but they produce scarlatinal rashes only occasionally, probably in individuals who are particularly susceptible to the streptococcal toxin.

At another girls' school, with about 250 girls, where the hygienic conditions were also extremely good, there was an attack rate for influenzâ of 55 per cent., together with a measles attack rate of 17.5 per cent., but no case of scarlatina occurred. Eight cases of otitis media occurred, all complicating measles. Swabs from six of these were examined, and all yielded Type 9 haemolytic streptococcus, which is another type belonging to the heterogeneous group.

At a boys' school with an extremely high attack rate of influenza, the attack rate of otitis media on the whole school was 9 per cent.

One of us (J. A. G.) has recently shown elsewhere[9] the relationship between epidemics of tonsillitis and epidemics of acute rheumatism, and it will be noted that the peak of the rheumatism wave follows the peak of the tonsillitis wave after an interval of some two or three weeks. This "lag period" between the onset of tonsillitis and the development of acute rheumatism was also noted by Haig-Brown, who observed that it might be as long as five to six weeks but was usually from ten to fourteen days. Assuming that acute rheumatism is an allergic phenomenon, this "lag period" corresponds to the time which must elapse between the therapeutic or experimental injection of anaphylactic antigen—for example, horse serum—and the establishment of the anaphylactic state.

An outbreak occurred in the winter of 1926-27 in an institution of some 2,000 boys, entering at 16 years of age, after medical examination, to undergo a nine months' course of training. There was a rapid continuous flow of new entrants. The boys slept in long dormitories, designed to accommodate 42 boys, and at the period shown there was overcrowding. There had previously been a good deal of acute rheumatism in the establishment. All the factors favouring a droplet infection were present at the appropriate season of epidemic prevalence. These included a community of susceptible age, rendered the more susceptible by sudden change from home conditions to a strenuous regime, a rapid continuous influx of new entrants, overcrowded sleeping quarters each containing many boys, facilitating that massive dosage and rapid transference of infection from person to person which seems to exalt the virulence of droplet infection, and convalescents or carriers remaining to carry over the infection from the last epidemic season. The epidemic season of late autumn arrived some three weeks after the most severe overcrowding, and the epidemic potential, which had gradually developed, reached a critical value, with the result that there was a sharp epidemic of tonsillitis, followed by an outbreak of acute rheumatism. The maximum overcrowding preceded by some two or three weeks the peak of the tonsillitis epidemic, which was followed at a similar interval by the peak of the acute rheumatism epidemic.

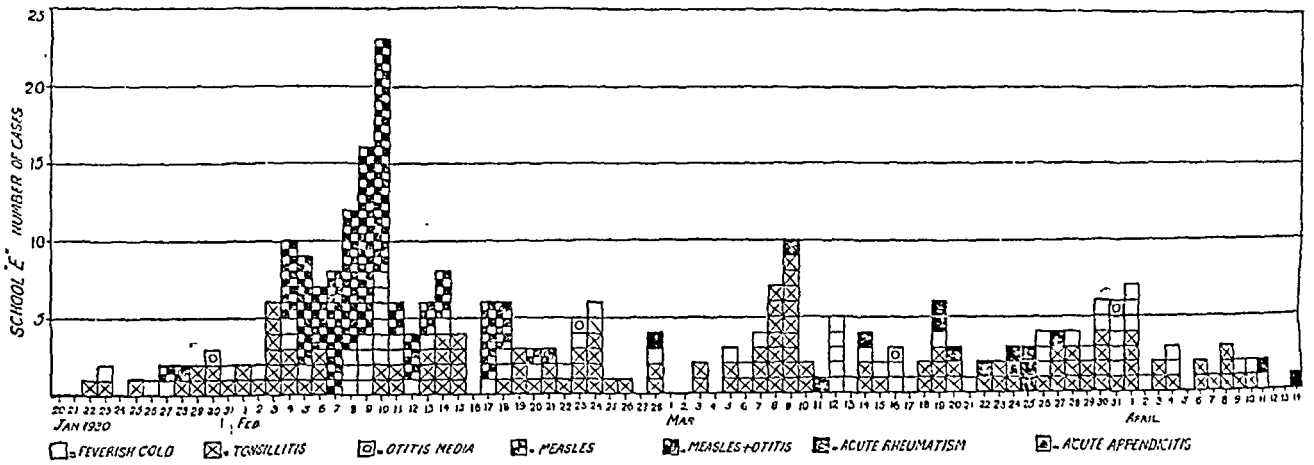

Fig. 3.—School E. Lent term, 1930. Population about 300. Epidemic of measles and tonsillitis followed by 15 cases of acute rheumatism.

ACUTE RHEUMATISM

Forty-six years ago, in a paper read in this Section at the Annual Meeting, on "Infectious Sore Throat in which Rheumatism plays a Prominent Part," Dr. Alfred Mantle[10] said:

"Infectious sore throat is by no means an uncommon disease, yet it is remarkable how little is said about it in medical literature . . . . One striking feature of the disease has been the presence of rheumatic symptoms in most of the cases, so much so that I believe rheumatism is a much more common complication of infectious sore throat than of sore throat of a non-infectious character."

After giving instances of multiple infection in houses—in one instance he attended 10 cases of rheumatism in two houses—he continued:

"These cases (i.e., of infectious sore throat) no doubt are some of those which help to supply the want of rheumatic history in many cases of valvular disease that we find in young persons. The cause I believe to be influenced by bad sanitary arrangements—crowded houses, with deficient ventilation and bad drainage."

About the same time, Haig-Brown described an epidemic of follicular tonsillitis at Charterhouse School. In the Christmas term of 1884 he treated 127 cases of acute tonsillitis. Among a total of 345 cases of sore throat there occurred 8 cases of endocarditis followed by chronic valvular disease, 3 cases of pericarditis, and 10 of mitral disease the patients suffering from which apparently recovered.

Two small epidemics of acute rheumatism have occurred in public schools since our inquiry began. One of these was in the Lent term of 1930 in a school with a population of about 300 boys, and is shown in Fig. 3. The term opened with an epidemic of 84 cases of measles; this reached its maximum on the 10th February, and, ending abruptly, had subsided by the 21st February. Preceding it and during its course, a good many cases of tonsillitis had occurred, and in the first fortnight of March there was a second wave of tonsillitis. In all, 136 cases of sore throat (122 with pyrexia) occurred, and

with these were associated 15 cases of acute rheumatism the proportion of acute rheumatism to tonsillitis being rather more than one to ten. There were also seven cases of otitis media, four cases of sinusitis and one of pneumonia. Four of the cases of otitis media followed tonsillitis while three followed measles. One case of otitis was followed by haemolytic streptococcal meningitis. The dormitory charts gave some evidence of bed to bed infection of tonsillitis and in one instance two of the patients who developed rheumatism within three days of each other slept in adjacent beds. The rheumatic cases did not occur until the bulk of the measles convalescents had returned to school, the crest of the measles wave preceded the tonsillitis crest by four weeks and the rheumatism by five.

Tonsillar and pharyngeal swabs were examined from eight cases in all of which definite rheumatic arthritis and carditis had followed tonsillitis. Five of these cases yielded cultures of haemolytic streptococci, all of which were of the same serological type. At the same school in the Lent term a year later (1931) there was again a considerable prevalence of tonsillitis, the attack rate for the term being 27 per cent. Swabs from 77 cases showed the presence of haemolytic streptococci, the majority of which were of one serological type and were different from the type found the previous year. In six of the patients rheumatic symptoms, four of which were described as acute and two as subacute, supervened. No scarlet fever cases occurred at this school although only 4·7 per cent. of the boys were protected by previous attack.

The other small outbreak followed the epidemic of tonsillitis which has already been described at school D. Four cases (three in the same dormitory*) occurred in the Christmas term and three in the Lent term. In five of the six cases the haemolytic streptococcus causing the tonsillitis was of the same type. In the sixth case haemolytic streptococci of an unidentified strain were present in abundance. In two cases (one with previous rheumatic arthritis) tonsillitis caused by the prevailing type of streptococcus was followed by erythema nodosum.

Epidemics of tonsillitis followed by severe relapses of acute rheumatism in child patients in special rheumatic wards and convalescent homes for rheumatic children have been described by various authors in this country (e.g., Raven[19] and Schlesinger[20]) and in America (e.g., Hiller[1] and, especially, A. F. Coburn[3]), and the recent work of Collis[6] on the bacteriological side and Sheldon[21] and Schlesinger[20] on the clinical side has demonstrated the great practical importance of this relationship. "There can be no doubt," says Schlesinger, "that rheumatic relapses are largely brought about by acute and often extremely mild throat infections."

Special precautions should be taken to exclude infection by haemolytic streptococci in such wards or homes, precautions which should include the widest possible spacing of beds, small wards to limit possibilities of spread, and ample accommodation for the isolation of any child or member of the staff who shows any sign or symptom of nasopharyngeal infection. In view of the great danger of infection, the question may be raised whether a rheumatic child should ever be admitted to the scarlet fever ward of a hospital for infectious diseases.

The following *tentative suggestions* seem to us to be justified in view of all the available evidence, much of which we have been unable to include for want of space.

(1) Epidemic tonsillitis is one of the most common causes of invalidity in boarding schools and is due to infection with haemolytic streptococci of the *Streptococcus pyogenes* group.

(2) Infection of the throat with haemolytic streptococci produces varying clinical pictures in different persons. These include first, a symptomless infection, or healthy carrier state, secondly, tonsillitis, thirdly, febricula, feverish catarrh or pharyngitis, without noticeable sore throat, fourthly, scarlet fever. Any of the latter three conditions may be followed by otitis media or by acute rheumatism.

(3) Many serological types of haemolytic streptococci may cause scarlet fever, but certain types, the four chief types, predominate. Types 1, 2, 3 and 4 are together responsible for 70 per cent. of the cases of scarlet fever admitted to fever hospitals in this country, the remaining 30 per cent. being caused by strains forming a group of heterogeneous types.

(4) Epidemic tonsillitis without rash is generally attributable to strains belonging to the heterogeneous group. These strains cause scarlatina when their toxigenic powers are sufficiently high to overcome the antitoxic immunity of the person attacked.

(5) Observations made on two outbreaks of tonsillitis (only one of which has been described) attended with severe complications but without typical scarlatinal rashes suggest that the two chief types concerned, Types 1 and 2, may not invariably be of high toxigenicity.

(6) In any epidemic of scarlet fever cases of tonsillitis and mild pharyngitis occur side by side with the cases of scarlet fever, and, if bacteriological examination be made, numbers of healthy carriers will also be detected all yielding the same type of haemolytic streptococcus as the scarlatinal cases. These unsuspected sources of infection constitute one of the most difficult problems in the control of scarlet fever.

(7) Epidemics of tonsillitis or the occurrence of "dropping" cases of scarlet fever, and perhaps of otitis media, in schools are generally associated with a high carrier rate of haemolytic streptococci.

(8) Epidemics of measles and influenza, even in good hygienic conditions, increase the spread of haemolytic streptococci which are the chief cause of serious complications in these diseases.

(9) Often, however, epidemics of tonsillitis and high carrier rates of haemolytic streptococci are signs of the existence of environmental conditions which favour a rapid and easy transmission of infection. Chief of such conditions are the following—too great proximity of beds, deficient floor area and deficient ventilation in dormitories.

(10) Adequate spacing and ventilation of dormitories and classrooms and proper intervals* between beds in dormitories and school sanatoria are important factors in the prevention of the spread of infection.

* It is an interesting fact that of the 45 boys in the dormitory there were only four with a history of scarlet fever all at least seven years previously and three of them developed rheumatism after the tonsillitis the fourth boy escaped both tonsillitis and rheumatism.

WORK OF A CHILD GUIDANCE CLINIC*

BY

BERNARD HART, M.D., F.R.C.P.

PHYSICIAN IN PSYCHOLOGICAL MEDICINE, UNIVERSITY COLLEGE HOSPITAL AND NATIONAL HOSPITAL, QUEEN SQUARE, LONDON.

The child guidance clinic is an essay in the field of mental hygiene, and its aim is to deal with the "difficult" or "problem" child. This term covers a range of cases whose essential feature is a disorder in the sphere of behaviour and, while it does not of course correspond to any precise clinical entity, it denotes a fairly well marked group of patients which will be familiar to every practitioner. We may roughly define the difficult child as one who, as a result of the operation of either endogenous or exogenous causes, is maladjusted to the environment in which it has to live and manifests this maladjustment in disturbances in behaviour.

The variety of conditions covered by this definition will be apparent from the following list of disorders accepted for treatment at the New York Institute for Child Guidance.

1. Children who present problems because of their socially unacceptable behaviour (whether legally delinquent or not), such as: temper tantrums, fighting, teasing, bullying, disobedience, "show off" behaviour, truancy, lying, stealing, rebellion against authority, cruelty, sex difficulties, etc., shown at home, school, or elsewhere.

2. Children who present problems manifested chiefly in personality reactions, such as: seclusiveness, timidity, sensitiveness, fears, cowardliness, excessive imagination and fanciful lying, "nervousness," excessive unhappiness and crying, stubbornness, selfishness, restlessness and overactivity, unpopularity with other children, and the like.

3. Children who present problems in habit-formation, such as: sleeping and eating difficulties, speech disturbances (such as stammering, thumb-sucking, nail-biting, masturbation, prolonged bed-wetting, etc.

All these disturbances have long been familiar to the physician, but their effective treatment has been beset by serious difficulties. In former days the difficulties arose because the nature of the disturbances was very inadequately understood, and their causation was explained by concepts which were narrow and inaccurate. On the one hand, a number of the phenomena were not recognized as belonging to the sphere of disorder, but were thought to be manifestations of "naughtiness" and original sin. On the other hand, a too exclusive emphasis was laid upon physical factors, and the causes of the evil were sought only in disease or disordered functioning of one or other organic system. So long as conceptions of this kind held the field therapeutic effort was necessarily limited to the remedying of whatever organic factors could be found, and the use of reprimand and discipline.

The results achieved by this method of approach were disappointing, and the advance of knowledge gradually brought about a radical change of orientation with regard to the whole problem. The change which has occurred may be said to have involved a progression from an ethical to a physical conception, and thence to one predominantly psychological and biological. It began to be appreciated that the causation was by no means so simple as had been supposed, and that in most cases a multiplicity of converging causal threads had to be disentangled before the mechanism of production could be understood. These threads led in various directions, to the parents, the home conditions, the school, as well as to the patient's constitutional make-up, and the habits of functioning of his body and mind. Only when all such factors had been investigated and appraised, both in themselves and in their interrelationships, could the nature of the child's condition be grasped, and appropriate therapeutic measures instituted.

With the increasing recognition of the complexity of factors involved, the task confronting the physician became correspondingly more formidable. The nature of this task will be apparent if we consider rather more in detail the character of the problem. The child is manifesting its disordered behaviour because of a failure of adaptation to its environment, due either to endogenous or exogenous factors and to their interaction. These factors may be of either a physical or mental order, and we must begin with the conception of the child as a psycho-physical organism reacting to an environment composed of material, mental, and social constituents, and disturbed in its reactions by faults involving an uncertain number of these various components. Hence the investigation which must precede treatment will require to ascertain something about all these things, and perhaps a great deal about some of them. We must know the child's physical and mental make-up, and appreciate the possible bearing which factors of either of these two groups may have upon the problem at issue. In particular we must be able to appraise the child's intellectual capacity, and temperament peculiarities, so as to understand the machinery with which he has to make his adaptation to life and environment. We must know the circumstances of his home and school life, and something of the sort of people with whom he comes in contact in both these environments. Finally, if our investigation is to lead to adequate treatment, we must have some machinery available whereby a modification of environmental factors, either in the home or in the school, can be attempted.

If we inquire why the treatment of the difficult child necessitates so elaborate an attack and one directed along so wide a front, the answer is that in behaviour problems we are concerned, not with disease of some particular organ or system, but with the reactions of a patient as a whole individual. With whole individual reactions all kinds of intrinsic and extrinsic factors and relations may have to be taken into account.

If the problem facing the physician who deals with the difficult child is so complex and accompanied by so many ramifications, it obviously cannot be easily solved by his individual efforts. Apart from the time involved, adequate investigation of the child's intellectual and other capacities cannot be made without special training and constant experience, and a satisfactory estimation of the home, school, and other environmental factors can only be carried out by a doctor who is able personally to visit these environments, and who has the necessary leisure to explore them. These requirements can obviously not be met under the conditions usually holding in a hospital out-patient department, and, if the problem is to be successfully attacked, some kind of team work must be organized.

CHILD GUIDANCE MOVEMENT IN AMERICA

It was the recognition of these essential facts which led to the foundation of the child guidance movement in America. This movement may be said to have commenced with the pioneer work of Dr. William Healy in the sphere of juvenile delinquency, and it has rapidly developed during the past ten years. The development has been largely dependent upon the generous assistance provided by the Commonwealth Fund, which has not only established demonstration clinics in various cities in the United States, but has in New York founded and maintained an Institute for Child Guidance in which there is

* Read in opening a discussion in the Section of Diseases of Children at the Annual Meeting of the British Medical Association, Eastbourne, 1931.

every possible facility for the development and extension of child mental hygiene The Commonwealth Fund has further extended its assistance to this country, and has completely financed for a limited period a child guidance clinic in London, which was opened in 1930 This is now in full activity, and it is hoped that, when the aid of the Commonwealth Fund is no longer available it will have so proved its value that other means of support and maintenance will be found for it In addition to this clinic others have been established both in London and the provinces whose methods and general aims are closely similar, and it may be said that the child guidance clinic now promises to become an integral part of our medical armoury

CONSTITUTION OF THE CLINIC

The essential feature of a child guidance clinic consists in the employment of a team of three persons, a psychiatrist, a psychologist, and a social worker These three persons investigate the patient and his environment from their respective standpoints, discuss and collate their results at a joint conference, and decide upon an appropriate line of treatment in the light of the causal factors which have been elicited During the progress of the treatment special work may be assigned to each of the three persons constituting the team, according to the particular directions in which action is indicated, and further conferences are held to guide and co ordinate the treatment required

The psychiatrist is the head of the organization and is ultimately responsible for the entire direction of the case In addition to his function as a general supervisor and director he has to undertake those aspects of the case which fall within his special province These include not only the investigation of the child s mental state, but also a physical examination in which all possible factors capable of producing an effect upon behaviour and adaptation have to be given their due weight These latter factors are often of fundamental importance, particularly the metabolic disturbances so frequent in difficult children, and unless appropriate measures are instituted to deal with them the problem cannot be adequately solved The psychiatrist must therefore be something more than a psychiatrist He must combine in himself the functions of a medical psychologist and of a paediatrician, and although it may perhaps be maintained that in the sphere of behaviour problems the medical psychologist must play the dominant part, there must be no possible risk of the purely paediatric aspects failing to receive their proper consideration In some clinics a paediatrician is added to the team and relieves the psychiatrist of his responsibilities on the physical side, but considerations of expense generally make this scheme impracticable It is clearly desirable, however, that a paediatrician should be available in a consultative capacity, to whom exceptional cases could be submitted for an opinion

The most important duty of the psychologist is to estimate the child s intellectual equipment, so as to determine the capacities of the weapon whereby adaptation has largely to be achieved This estimate is made by the employment of the various standardized tests which now enable us to measure in a fairly satisfactory manner the intelligence and educational acquirements of the patient The intellectual capacity thus determined is expressed as a proportion of that to be expected in an average child of the same age the so called "intelligence quotient" or I Q It is extremely important that these tests should not be carried out in a mechanical manner, and they are indeed likely to produce absolutely fallacious and misleading results except in the hands of a trained and experienced investigator In addition to this task the psychologist may be able to throw most helpful light on the case by observation of the child s attitude and behaviour during the testing, and may be able to assist materially in the subsequent treatment by steering the patient through difficulties of various kinds which may exist in educational activities, for example a specialized inability to learn some one subject

The function of the social worker is to obtain full information with regard to the environmental conditions and past history of the child, and to take whatever action is decided upon in the way of attempting to modify environmental factors It will be necessary for her to visit the home, to get into touch with teachers at the school and to act as a liaison officer between the clinic and the various social and charitable agencies whose aid may be required in carrying out plans for the child s welfare To fulfil such multifarious and responsible duties as these the social worker must not only possess exceptional ability and tact, but must have undergone a thorough and specialized training

CRITICISMS

I have made no attempt to do more than to set out in general terms the principles upon which the methods of the child guidance clinic are based The details of the work carried out and the description of illustrative cases I am leaving to Dr William Moodie, who follows me in this discussion, and who, as the director of the London Child Guidance Clinic has a far more intimate practical acquaintance with the actual work than has fallen to my lot I shall try to evaluate, however the contribution to practical medicine which the child guidance clinic is able to make, and particularly to enumerate the criticisms which may be levelled against it in the hope that they will be dealt with in the ensuing discussion

It is beyond question that the clinic is an efficient weapon for dealing with the difficult child and a better weapon than any hitherto devised A doctor with a liking for this sort of case, a great deal of special experience and ample time, may obtain excellent results by his individual effort, and may gain more by having all the threads in his own hand than he loses by not having at his disposal the organized team of the clinic But these requirements are rarely fulfilled, and in general the assistance of the clinic will be invaluable to the harassed practitioner, who has neither the time nor the opportunity to deal adequately with a class of case which, though apparently so trifling, involves nevertheless a great expenditure of effort

It may be pointed out that, in spite of the fact that these troubles often appear to possess only minor importance, they may be fraught with most serious consequences if they are left uninvestigated and untreated, and that therefore the clinic, in addition to the services it is able to offer to the individual patient, has a considerable value to the community because of what it is able to effect in the sphere of prophylaxis It will be remembered that the child guidance movement had its roots in the study of juvenile delinquency and the endeavour to modify those factors upon which it was believed that the development of delinquency depended Further investigation has certainly tended to confirm the view that asocial conduct can in many cases be traced back to the operation of various endogenous and environmental causes, which are capable of being elicited and removed by the machinery of a child guidance clinic The work of the clinic can therefore claim to be of considerable assistance in the prevention of delinquency and a close association between clinic and children s court has produced practical results of very great value

A further prophylactic function of the clinic concerns the psychoneuroses the conditions formerly known as functional nervous disorders In the investigation of developed adult cases of these disorders it is customary

to find a web of remote causes extending back into the childhood of the patient, and it is reasonable to suppose that, if these causes had been disentangled and remedied during the actual period of childhood, the later psychoneurosis could not have subsequently developed. The great importance of the early years of childhood as the phase in which the ultimate fortunes of the individual are rigidly determined has been emphasized by many otherwise completely divergent schools of thought. The Fathers of Port Royal are reported to have said that if they had a child for the first six years of its life they did not care who taught him later. The psycho-analytical school believe that the essential structure of the mind is fashioned in the first few years of life, and that later psychoneuroses can only grow in soil which has been specially prepared in that early period. The behaviourists, again, with their view of the infantile mind as something like a *tabula rasa* except for a limited number of reflexes capable of endless variations by the "conditioning" which occurs in early life, must necessarily attach fundamental importance to the management of childhood. It would appear, therefore, that the child guidance clinic can play a great part in remedying minor disturbances in childhood which may, if left untreated, pave the way for all kinds of more serious conditions in later years, and particularly for the whole range of the psychoneuroses.

We do not know how far a similar prophylactic function may apply to the later development of actual psychoses. Even here, however, there are indications of a possible line of attack. Considerable evidence has accumulated in recent years for the view that certain psychoses, manic-depresssive and schizophrenic, are only likely to develop in certain types of individual, and that the recognition of the type in the normal person will enable us to predict the variety of psychosis which is liable to develop, though this development is of course by no means inevitable. If this relationship can be established there would appear to be ground for hoping that careful and adapted management of a child in whom the characters of a particular type were prominent might lessen the chance of the corresponding psychosis developing in later life. For example, the boy of marked "introvert" type—seclusive, tending to live in himself, and unable to adapt easily to social relationships—might be trained to modify these reactions in some measure, and hence to avert the risk of a later schizophrenic development.

So much for the services which the child guidance clinic may perform, some of them solid and of unquestionable value, others much more hypothetical and only to be regarded as hopeful avenues for exploration. Let us now consider the criticisms which may be levelled against the clinic as a part of our practical medical armoury. The first obvious objection is that the employment of a team of workers, each investigating the patient from a particular angle, involves the loss of that close clinical and personal touch which characterizes the work of every good physician. It is true that the method of holding frequent conferences between the members of the team goes some way to obviate this criticism, but it is nevertheless valid enough, and the physician with time and opportunity will probably prefer to dispense with a social worker, if not with a psychologist, and to do their share of the work himself. This is indeed likely to be necessary when dealing with patients of certain classes, because the employment of a social worker would be impracticable except in very limited ways. For great numbers of patients, however, and particularly for those whose only alternative centre of treatment would be a hospital out-patient department, the objection is irrelevant, because no other adequate scheme is possible. Whether or not the individual is better than the team method is not of great moment when only an absolutely ineffective individual attack is feasible. We may admit the disadvantages of the team approach, but clearly these are outweighed by the advantages.

The second and most formidable criticism concerns the costliness of the child guidance clinic. In view of the amount of time and labour involved in each case the cost per patient is undoubtedly very high, and unless the expenses can be cut down it is difficult to see how a wide extension of child guidance work will be possible. By skilful organization, however, particularly the classification of cases by the psychiatrist, so that the whole machinery of the clinic is only brought into play where it is needed, considerable economies in time and effort can be effected, and hence the total cost of working greatly reduced. At the best, however, the method will remain an expensive one, and there are some who believe that the chief value of the clinic will ultimately be, not the services it renders to the individual child, but the training of workers and investigators who will carry a trained understanding to schools, courts, and other places where it will prove capable of fertile employment.

Other criticisms are levelled at the method of treatment in itself, mainly on the ground that it does not conform to the method which the objector believes to be the only valid approach. Criticisms of this kind may come from several quarters, and are clearly mutually destructive. The principle firmly maintained by most of the child guidance clinics in America and in this country, and which I believe to be fundamentally sound, is that in this work a catholic point of view, with the avoidance of a narrow adherence to the doctrine of any particular school, is absolutely necessary. We must be prepared to view each case from the widest possible angle, to consider that all kinds of factors may be playing a part, and to do our best to modify those factors which seem to be contributing to the undesirable situation by any and every means which presents itself to our hand. This is the attitude of the child guidance clinic, and it would appear to offer a line of attack which cannot fail to be fruitful.

THE DIABETIC ACUTE ABDOMEN

A TYPICAL CASE

BY

R. D. LAWRENCE, M.D., M.R.C.P.

C. G. MILLMAN, M.R.C.S., L.R.C.P.

AND

F. E. PILKINGTON, M.R.C.S., L.R.C.P.

KING'S COLLEGE HOSPITAL, LONDON

It is well recognized that severe ketosis and acidosis in the diabetic may be associated with digestive disturbances, such as nausea, vomiting, constipation, and colic; but little attention, if any, has been drawn in this country to the violent and puzzling abdominal pains that may occur, although a few cases have been recorded in America[1 2 3]. In such a case the signs and symptoms in the abdomen may simulate so closely those of an acute abdominal catastrophe that surgical intervention has been needlessly undertaken. The differential diagnosis was especially difficult in the case we are recording, in which a high polymorphonuclear leucocytosis was present.

HISTORY OF THE CASE

The patient, a robust man of 31, was known to have had fairly severe diabetes since 1924. He was investigated in this hospital in 1928, and went home taking 40 units of insulin twice a day and a liberal qualitative diet. He kept

quite well until March 14th, 1931, when he was brought up to the casualty department in a marked hypoglycaemic attack (produced by an unusual amount of exercise) in which he almost lost consciousness. He responded quickly to glucose treatment, and, feeling fit, discharged himself on Monday, March 16th. His bowels, which were usually quite regular, were not opened on Monday or Tuesday. On Monday afternoon he felt rather drowsy and went to bed, and took no food or insulin for the rest of the day. He had a poor night and vomited four times. On Tuesday morning he again felt drowsy and had some nausea, so he stayed in bed and took no insulin. At 1 p.m. he had a sudden attack of very severe generalized abdominal pain, which was especially severe round the umbilicus. The pain was very intense and quite continuous. At 4 p.m. the patient was seen in the casualty department. He was rolling in agony on the couch, clasping his knees and calling out for morphine. His temperature was 97.6°, pulse rate 136, and respiration rate 36. All his abdominal muscles were absolutely rigid, and the abdomen was if anything, retracted. Pressure made the pain worse, and it seemed to be aggravated on inspiration. The lower intercostal muscles on both sides were in spasm. The urine contained a fair amount of sugar (about 1 per cent.) and a large amount of acetone bodies, although the ferric chloride test was negative. The patient was not drowsy and had no signs of approaching coma. Both knee-jerks and ankle-jerks were absent.

DIFFERENTIAL DIAGNOSIS

Four possible diagnoses were suggested. First, severe and acute diaphragmatic pleurisy; secondly, a tabetic gastric crisis; thirdly, an acute abdominal catastrophe such as a perforated gastric ulcer; and, later, the rare condition of severe diabetic "colic." The character of the pain, the spasm of the intercostals, and the rather rapid respirations were in favour of pleurisy; but there was no cough, no friction was heard, and the temperature was subnormal. The absence of knee and ankle jerks and the severity of the pain naturally made one think of tabetic crisis, but there were no other signs of syphilis; the Wassermann was found later to be negative. Two alternatives remained—the true acute abdomen and the diabetic acute abdomen; the differential diagnosis between the two seemed impossible. There was no history of previous indigestion, and the patient was not in the least drowsy; in fact, there were no signs of approaching coma.

FURTHER HISTORY OF THE CASE

At 5 p.m. on Tuesday, March 17th, the patient was given 1/4 grain of morphine, and at 6.45 p.m. 60 units of insulin; it was decided to await further developments. At 7 p.m. the picture had completely changed. The patient was rapidly becoming collapsed, the pulse rate was 150, there was marked drowsiness and air-hunger. The eye tension was much lower, the tongue was raw and dry, the urine contained more acetone—a remarkably quick change in two hours. The abdomen was as before, and it was noticed that there was more tenderness on the right side than on the left. An enema was given with a fair result.

At 9.30 p.m. the blood sugar was found to be 0.644 per cent. At 10.30 p.m. it was 0.580 per cent. A leucocyte count at 10.30 p.m. showed 51,000 total leucocytes; 93.6 per cent. were polymorphonuclears, including many metamyelocytes; 6.4 per cent. were lymphocytes. The pulse rate was still 150, and the abdomen as before. It was then decided to operate if the pulse became any worse.

More insulin (60 units) and glucose (20 grams) were given at midnight, when the pulse rate was 130 and the patient a little more comfortable. At 6 a.m. the following morning the pulse was 118 and much stronger. The abdomen was still tender (although the pain had gone), and still a little rigid. A blood count at 10 a.m. showed 26,600 leucocytes, 91.2 per cent. of which were polymorphonuclears. The blood sugar was 0.184 per cent. and the patient was better in every way. The diagnosis of uncomplicated diabetic acute abdomen was then assured; the patient rapidly improved and was discharged fit three days later.

The subsequent behaviour of the blood cells is shown in the following table:

Date	Time	Red blood cells in millions	Haemoglobin. Per cent.	Total leucocytes	Polymorphonuclears. Per cent.
March 17th	10 p.m.	6.0	112	51,000	93.6*
,, 18th	10 a.m.	6.3	112	25,000	91.2
,, 18th	10 p.m.	6.1	120	18,400	87.6
,, 19th	10 a.m.	5.9	120	10,200	79.5
,, 20th	10 p.m.	6.3	122	9,000	71.6
May 14th	8 weeks later	5.7	124	9,000	81.0

* Including many metamyelocytes.

DISCUSSION

At one time the diagnosis and the advisability of operation were matters of extreme doubt. Even later, when the increasing ketosis and impending coma made the diabetic condition the probable cause, it was difficult to be sure that some acute surgical condition was not also present. Had we not known that a high leucocytosis may be present without any septic focus, the high count would have demanded immediate operation. The decision was made to operate if the pulse became worse, and if the diminution of the ketosis by the insulin did not relieve the pain and abolish the rigidity. Both pain and rigidity, however, rapidly diminished as the insulin took effect, and the man's general condition at once improved.

It should be stated that this clinical syndrome of intense abdominal pain, tenderness, and rigidity is very rare in severe ketosis and even in impending coma, although some sickness and moderate colic is common enough. We can make no serious suggestion as to the cause of the syndrome or of the accompanying leucocytosis.

SUMMARY

An extreme case of the acute abdominal condition occasionally associated with severe diabetic ketosis is reported. Intense abdominal pain, tenderness, and rigidity, and a high leucocytosis were present, simulating an acute abdominal condition. All the acute symptoms disappeared within twelve hours of adequate insulin treatment.

ELECTRICAL TREATMENT OF NEURITIS AND WRITER'S CRAMP*

BY

W. BLACK JONES, M.D.,

CREIGHTH, CARDIFF

The treatment of neuritis by electricity was advocated by the late Dr. Naunton Davies some thirty years ago. He published his results in the *Bristol Medico-Chirurgical Journal* in June, 1915, stating that the method was applicable only to interstitial neuritis in which there is hyperaemia and exudation in the nerve sheath. The diseased areas are limited in extent, the spots are often the size of a split pea, or smaller, the nerve between them being free from trouble. If a spot is overlooked, pain may remain in that spot, and radiate over a wide field.

* A paper read before the Cardiff Medical Society, April 14th, 1931.

DAVIES'S METHOD

The method adopted by Davies consisted, first, of testing for the affected spot; the negative pole of a faradic current is connected with a conical-shaped electrode covered with wash-leather, the positive being a large pad, which is connected to the arm or leg. Both electrodes are moistened with saline solution. The faradic current is so regulated that it will excite pain in the diseased spot, but will not cause pain in a healthy nerve. When the spot is touched with the electrode and pain is felt, the position is marked. The second stage is that of treatment, and for this purpose the galvanic current is employed. An insulated needle is connected with the negative pole, the large pad remaining positive. A local anaesthetic is next injected under the dermis, the needle is inserted, and the current is turned on; the needle is directed to the point where the pain is most acute. The current should not exceed 6 milliamperes; the needle is withdrawn after ten minutes.

A NEW TECHNIQUE

Having had an experience of nearly one hundred cases, I have modified the above technique slightly. The current used generally does not exceed 1 mA, frequently it is 0.2 mA. It is found that five minutes' duration is sufficient for the treatment; frequently after four minutes the patient states that the pain is diminishing. Two spots are often treated at one sitting. As to the apparatus, a pantostat may be used, but for some years I have used four dry cells, which can be carried in a portable case. The weak secondary circuit of an induction coil gives the faradic current. Frequently only two or three of the cells are used; more would cause unnecessary pain. The general results of the treatment show that where one or two spots occur on a particular nerve the action of the current gives immediate and permanent relief. If the faradic current is again applied to the spot after an interval of a few days, and no pain is felt, it is concluded that the spot is cured. Thus when a spot has been treated no second treatment is necessary. Occasionally when a spot is found there may be felt under the skin a small nodule; this disappears with the application of the galvanic current; the nodule may be a deposit of uric acid. On the other hand, when the number of spots is multiple, and when they are close together, the results are not so satisfactory and the relief is often only partial, or it may be some time before a moderate amount of success is obtained; this is assisted by the internal administration of iodine.

Neuritis occurs usually in superficial nerves, when those near a joint are affected, movement is limited, and the joint becomes more or less crippled. In rheumatoid arthritis the pain is sometimes due to neuritis surrounding the joint; the above method gives much relief. Neuritis of the forehead and scalp is often very painful, and does not easily respond to medicinal treatment. Frequently one spot alone is responsible for all the trouble; in such cases the treatment gives immediate relief. In the forehead, the nerve which is chiefly affected is the supratrochlear branch of the frontal nerve; this emerges from the orbit and supplies the lower and mesial part of the forehead. Of twenty-eight cases of neuritis of the forehead and scalp, this nerve was involved in twenty-three cases; in sixteen cases it was the only nerve affected.

ILLUSTRATIVE CASES

I now propose to give a few cases illustrating the treatment and the results.

In April, 1923, a man came to me and stated that he had had an attack of influenza five weeks previously, with acute pain in the forehead since then. I found two spots on the left supratrochlear nerve; these were treated, and complete relief was afforded. In September, 1926, he returned, complaining of pain on the right side of the forehead. A spot on the corresponding nerve on that side was successfully treated.

In August, 1924, a lady was sent to me. She had suffered for two years from frequent and acute attacks of pain in the forehead. Often she was confined to bed for two or three days at a time; medicinal treatment afforded little relief. I found one spot on the left supratrochlear nerve, and treated it; the relief has been permanent. Her doctor informed me in September last that she had had no recurrence of pain since the treatment.

Neuritis is common in the region of the shoulder-joint and is occasionally mistaken for some kind of rheumatism. It limits movement of the joint, and may render the patient more or less unfit for his occupation. A frequent site of pain is over the deltoid muscle, the circumflex nerve being affected. Other sites of the lesions occur below the clavicle and over the scapula, occasionally also at the inner border of the latter bone.

A woman, aged 62, complained of pain for four years in the left shoulder, with inability to carry out many of her household duties. Two spots were found over the left deltoid, and were treated. Immediately afterwards she was able to raise her left hand to the top of her head, which she had been unable to do for four years. A few days afterwards another spot was found over the right deltoid; application of the faradic current to the old spots on the left side caused no pain. She was soon able to resume her household work without difficulty.

Neuritis of the deep nerves of the forearm appears to be one of the causes of writer's cramp. Three cases have come under my notice; two were slight, and easily responded to treatment. The most marked case was that of myself. For several years my handwriting had become steadily worse and very cramped; some wasting of the thenar muscles was present. I placed myself under the care of Dr. E. A. Goulden of Llandrindod Wells, who treated eleven points on the right forearm, seven on the anterior aspect and four on the posterior. Improvement was at first very slow; tincture of iodine was administered, and massage was applied. In a few weeks movement improved; later on, the whole trouble gradually cleared up and there has been no return of the disease.

Neuritic pain in the region of the hip is often associated with neuritis of the small sciatic nerve or its branches; frequently one or two spots are affected.

A woman, aged 54, who complained of pain in the region of the sciatic nerve, came to me in September, 1925. I found two spots, one on each of two branches of the small sciatic nerve; both were treated and the pain was relieved.

Another woman, aged 48, had suffered from sciatica for two years. I saw her in August, 1926, and found one spot on the small sciatic nerve on the left side, two spots on the similar nerve of the right side, and a spot on the ilio-hypogastric nerve. I heard from her in July, 1929, when she reported she was quite well.

Of thirteen cases of neuritis in the neighbourhood of the hip, in all but one the small sciatic nerve was affected. I have not treated a case where the great sciatic nerve was involved. Several cases have been treated in which pain is situated near the knee-joint.

In August, 1926, a woman was brought to me in a bath chair; her history was that for nine weeks she had been unable to do any household work, and had to be assisted in walking about the room. Examination showed a spot on the upper border of the right patella. This was treated, and in a few minutes she was able to walk more easily, and within a week was able to walk two miles. A spot on the right clavicle and another on the right deltoid muscle were also treated. She wrote to me in July, 1927, that she had remained well, and had had no return of her trouble.

The above cases show that the galvanic treatment of neuritis affords great hope for the relief of a disease which causes much pain and discomfort.

Memoranda

MEDICAL, SURGICAL, OBSTETRICAL

CEREBELLAR HAEMANGIOMA

The following recent case is of interest in association with Dr. W. T. Collier's article on Lindau's disease (*British Medical Journal*, July 25th, p. 144).

A man, aged 63, was found unconscious. At 6 a.m. I was called out to see him. I learned that he had always been in perfect health hitherto, and had never complained of anything. At 10 o'clock on the previous evening he complained of giddiness. He left the house to post a letter, and vomited on returning. He went to bed complaining of giddiness. At 6 a.m. he was found unconscious.

On examination the patient was comatose, respiration regular and deep, 24 per minute; no stertor. All tendon reflexes absent. No rigidity of limbs. Babinski's extensor response in both legs. Pupils pin-point, not reacting to light. Pulse 120, good volume. Blood pressure, 120/90. Retinae could not be examined, the pupils were too contracted. No incontinence of urine or faeces. Catheter specimen of urine contained an enormous amount of sugar. No acetone or aceto-acetic acid. The patient died at 5 p.m. on the same day.

A post-mortem examination revealed the presence of a cerebellar haemangioma in a lateral lobe. The wall was thickened, and it contained a lot of fresh blood. The pancreas and kidneys showed no cystic degeneration. The retinae were not examined.

This case is interesting in view of the absence of all previous history in spite of the presence of a thick-walled large cerebellar haemangioma. The presence of glycosuria led one to think of diabetic coma, but the absence of acetone and diacetic acid excluded that possibility.

JOSEPH MINTZMAN, M.R.C.S.,
London, N. L.R.C.P.

ACUTE OSTEOMYELITIS OF THE ILIUM

The article on this condition by Mr. A. Rendle Short, in the *Journal* of July 18th, prompts me to mention a case that passed through my hands. In view of the apparent rarity of the condition I think an account of the case is justifiable.

A boy, aged 19, was admitted to the Llwynypia Hospital on December 17th, 1930, as a case of septic arthritis of the left hip-joint. He had been ill at home for one month, complaining of constant pain in the hip. His doctor had thought the condition one of tuberculosis, and this was confirmed by the tuberculosis medical officer of the district. Treatment by rest and weight extension failed, however, to relieve the pain or reduce his temperature. Two days prior to admission haematuria developed, and the boy's condition changed for the worse.

On admission the patient was in a very toxic state, with immobility of the left leg and pain on active movements. There was no deformity, and rotary movements of the femur were painless. There was acute tenderness on pressure all along the crest of the ilium, with swelling and dilatation of the surface veins around. On exploration of the swollen area around the iliac crest with a 5 c.cm. syringe, yellow pus was found, examination of which showed staphylococci. Apart from the confirmation of the presence of blood in the urine, nothing else of importance was discovered on clinical examination.

The same evening an operation was performed. Through an inverted anchor-shaped incision the iliac crest was exposed and the gluteal muscles turned down. A large sub-periosteal abscess was opened while this was being done, and it was observed that the periosteum was thickened and showed evidence of new bone formation. The ilium was trephined and necrotic bone removed all round. The bone was very friable and came away easily. The wound was bipped and freely drained, and the leg was fixed on a double abduction frame with extension. The boy was in a very shocked condition at first, but after two days his temperature fell to normal, and he made an uninterrupted recovery.

In June, 1931, an *x*-ray was taken and showed the hip-joint to be quite free from disease. A small superficial sinus still remains, but the patient is able to walk normally and has good movements in the left hip. It is noteworthy that the haematuria disappeared spontaneously twenty-four hours after the operation.

Commentary

The length of time before the diagnosis of osteomyelitis was made is to be noticed. The value of the "anvil" and the "rotation of the extended leg" tests in distinguishing between an intra-articular and an extra-articular lesion of the hip-joint was well exemplified in this case. The success of a somewhat radical operation in the presence of grave toxaemia is interesting in connexion with the question of treatment.

CLINICAL AND SCIENTIFIC PROCEEDINGS

CALCUTTA BRANCH

SYPHILITIC DISEASES OF THE EYE

At a clinical meeting of the Calcutta Branch on July 10th, with Dr. KENDARNATH DAS in the chair, Lieut.-Colonel E. O'G. KIRWAN, I.M.S., read a paper on syphilitic diseases of the eye, in which he presented an analysis of cases treated at the Eye Infirmary of the Calcutta Medical College during 1930.

Lieut.-Colonel Kirwan said that of the total of 26,067 cases, 788 (3.02 per cent.) were syphilitic. The Wassermann reaction was positive in 740 cases; of the 318 negative cases 169 patients gave a history of previous syphilitic disease and treatment, and 131 showed the stigmata of congenital syphilis. In order of frequency came iritis, optic atrophy, interstitial keratitis, iridocyclitis, optic neuritis, cataract, choroiditis, chronic conjunctivitis, and ophthalmoplegia. Less frequent were primary glaucoma, gummata, vitreous opacities, primary sore on the conjunctiva, and retrobulbar neuritis. Primary syphilitic conditions of the eye were very rare, only two cases occurring in the figures. Interstitial keratitis was extremely important, since it caused so much unnecessary blindness, and its recognition should always be possible by the general practitioner. It involved the deep layers of the cornea, which were rendered opaque from the inflammation. Infiltration began at the centre or periphery; the corneal surface became like ground glass, but there was no break in the epithelium. Vascularization was effected by the scleral branches of the anterior ciliary arteries, the new vessels being arranged in tufts without the branching seen in pannus. The attack was often precipitated by injury, and this had an important medico-legal bearing in workmen's compensation cases. Both eyes were likely to be attacked, sometimes simultaneously, sometimes at different times; early and energetic treatment would avert the otherwise inevitable involvement of the other eye. Cavill and Darby had reported such success in 18 per cent. of cases, and it was now held that such treatment would ameliorate and hasten the treatment of involvement of the second eye while dealing with the first. In India the cases were usually seen late, and therefore both eyes were involved. This observation should disprove the commonly held

opinion that anti-syphilitic treatment was of little use in interstitial keratitis.

Iritis and irido-cyclitis were common complications of syphilis; Colonel Maynard had stated that 1 to 4 per cent. of syphilitic patients in India had iritis. The nodules seen on the iris were not gummatous, and were not tertiary manifestations. Iritis associated with a positive Wassermann reaction was not necessarily syphilitic; septic teeth infections were very common sources of focal affections of the eye. Cyclitis often accompanied syphilitic iritis. Optic atrophy due to syphilis was a frequent occurrence; treatment, if early and energetic, might prevent blindness, which was otherwise the end-result of optic atrophy. Cataract due to syphilis was common in juvenile cases; no operative intervention was justifiable when the Wassermann reaction was positive. Iritis was almost certain to occur. An exception might be made in secondary glaucoma. Pseudoplasmata were commonly due to the chronic inflammation of syphilis. Chronic conjunctivitis, one of the most interesting of syphilitic complications, was usually, however, a tarsitis, and was commonly diagnosed as trachoma; trachoma occurred very rarely in Bengal. The routine treatment of all syphilitic ocular conditions in the Eye Infirmary consisted of weekly intramuscular injections of metallic bismuth and sulfarsenol. Syphilitic optic neuritis might apparently get worse with treatment, and in such cases the arsenic should be stopped. The course of treatment was twelve weekly injections of bismuth and sulfarsenol, followed by a course of potassium iodide. The Wassermann test was performed three months from the day of the last injection. If the reaction was positive, another course of injections was commenced. Early and energetic treatment in all ocular manifestations of syphilis was essential, though the prognosis in optic atrophy and interstitial keratitis in the adult was bad.

Lieut.-Colonel HARNETT, I.M.S., emphasized the necessity of considering syphilis as a possible causal agent in eye conditions; the Wassermann test should be performed in every case where syphilis might be the cause. As regards interstitial keratitis there were still some who held that general treatment was of little avail. With regard to treatment he himself found it necessary to intermit the injections every three weeks, especially in the case of arsenic. Dr. S. K. MUKHERJEE stated that in his experience arsenic and bismuth injections had proved superior to mercury treatment in interstitial keratitis. The time required for treatment was much shorter, and there was less likelihood of the other eye becoming affected. In India, however, the latter complication was unfortunately common. This disease was common in girls about puberty, and in males about 6 years of age and after the "teens." He advised intravenous injections in acute cases of eye syphilis, although as a hospital routine it was difficult to carry out.

Lieut.-Colonel KIRWAN, in reply, stated that the newer school of ophthalmologists were all practically agreed that the treatment of interstitial keratitis on general lines was beneficial; some cases, however, were undoubtedly refractory. Mercury, he considered, had a place in the treatment of ocular syphilis, but in hospital practice it had been given up, mainly owing to the large amount of dental defects in the patients. He agreed that intravenous injections were useful in certain cases—iritis, for instance. Examinations of the cerebro-spinal fluid might be made more frequently, but experience had shown that in eye cases the reactions did not differ much in the great majority of cases from those of the blood.

EARLY USE OF FORCEPS IN ENGLAND

Dr. KEDARNATH DAS read a paper on the use of midwifery forceps in England two hundred years ago, and showed copies of two books published in London in 1710 and 1735 by Drs. Giffard and Chapman respectively. He read numerous extracts from these books. It was evident, he said, that the forceps or extractors were in fairly frequent use in England at this period. Giffard's book contained a description of 225 deliveries, in thirty-five of which forceps were used. Chapman stated that he "could produce many other instances in which forceps were used in this town." Their application was restricted to "low" cases, and they were employed in malpresentations of the head mainly, and in delay or obstruction of the head in the passage. Fairly sound descriptions of how to apply the instrument were given in these books; apparently they were inserted in the antero-posterior and not the lateral plane. Chapman advised loose forceps, the handle being left unscrewed. He had realized the benefit of this method from having lost the screw on one occasion, and being unable to find it. Giffard described how in one case, having failed with forceps, he completed delivery by version. The use of forceps was by no means generally approved by the profession of those times, and Chapman in his preface submitted a vigorous defence of the instrument against its detractors, whose adverse opinion was based on ignorance or misuse. He predicted that in a short time they would be extensively used by every country practitioner, and that the crotchet and blunt hook would disappear.

Dr. J. M. DAS said that at the present time Caesarean section held the field, and it appeared that shortly there would be no need for forceps, for the child would never pass through the ordinary passages. It would be interesting to speculate on the midwifery of 200 years hence.

Lieut.-Colonel HARNETT, from the chair, thanked Dr. Kedarnath Das for his very interesting historical paper, and congratulated him on having been able to amass such a valuable collection of books and instruments. The paper was specially noteworthy when it was remembered that in those early days it was considered hardly respectable to practise midwifery; hence the debt that the science of medicine owed to men like Giffard and Chapman.

MEDICAL CONGRESSES, 1931

The following congresses and conferences on medical and allied subjects have been announced for the remainder of the year. Particulars are given below in the following order: date, name of organizing body, place of meeting, name of person to whom inquiries should be addressed. More detailed information about these meetings is given from time to time, as it becomes available, in the news columns of the *British Medical Journal*.

September 21.—Royal Institution (Faraday Centenary). London. Secretary of Royal Institution, 21, Albemarle Street, W.1.

September 21–23.—German Pharmaceutical Society. Vienna.

September 21–23.—German Association for Occupational Hygiene. Nuremberg. Secretary of Association, Platz der Republik 49, Frankfort.

September 23–25.—Society for the Study of Metabolism and Diseases of Digestion. Vienna. Professor von den Velden, Bambergerstrasse 49, Berlin, W.30.

September 23–30.—British Association's Centenary Meeting. London. Secretary of Association, Burlington House, Piccadilly, W.1.

September.—Pan-Russian Congress of Gynaecologists and Obstetricians. Moscow.

October 1–3.—German Society for Urology. Vienna.

October 14–18.—International Congress of Comparative Pathology. Paris. Dr. Grollet, 7, Rue Gustave Nadaud, Paris, XXVIe.

Reviews

HUMAN HEREDITY

For the first time the well known work *Human Heredity*,[1] by BAUR, FISCHER, and LENZ, is available in English The plan of the book is designed to provide a theoretical demonstration of the facts upon which individual human heredity depends, and it is stated that the volume will thus form the scientific groundwork for a later treatise, to be entitled " Human selection and racial hygiene," in which will be discussed the practical inferences to be drawn from the theoretical knowledge acquired up to the present time In the opening section Professor Baur gives an outline of the general theory of heredity This outline is compact and lucid, as is to be expected from one who has a high reputation not only for his original researches, but also for the exposition of his subject Professor Fischer contributes a section on racial differences in mankind This follows accepted lines, and the subject matter takes its place very appropriately in this volume There are the usual photographs illustrating different racial types and crosses—a considerable number of them The English are represented by a single illustration, which, curiously enough, is one of that distinguished Irishman, the great Duke of Wellington, and we are urged not to fail to notice the strongly arched nose

The physician will probably be especially interested in the third section of the book, written by Professor Lenz, which deals with defects and deficiencies conditioned by Mendelian factors To those unfamiliar with this subject the great number of such conditions will doubtless come as a surprise The treatment is very clear, the pedigrees are well chosen, and an attempt has been made to group the various conditions according to their clinical relationships The author specifically states that he has not attempted to make the list complete This is perhaps unfortunate, but those who are familiar with the vast and scattered literature will certainly sympathize with him A list of inherited conditions may serve a very useful purpose if it is complete If it is not complete, it serves to illustrate the subject and this, we read, was the author's intention To fulfil this purpose the list is unnecessarily long, but in fact, although the author does not claim it, it is remarkably complete The great majority of conditions known to be inherited are described and this section of the volume will serve as a very useful work of reference Its usefulness would, however, be greater if the index were more sensible Surely the first and most obvious classification is under the names of the various conditions The reader will find that this is not a primary classification in the index He will have to look through the text in order to discover the author's classification of conditions under various bodily systems, and he will then find the various conditions listed under these headings As a contrast to this regrettable economy, the reader will be surprised to find more than four columns of references all commencing with the word " Über " and a column and a half commencing with the word " Zur," these, of course, referring to original papers quoted in the text

A short but very important section, written by Professor Lenz, deals with the methodology of the interpretation of statistical results It is of the utmost importance to recognize that the theory of heredity takes a mathematical form, and that statistical checks should be applied to every problem and to the fitting of every ratio Professor Lenz's treatment forms an admirable introduction to this development of the subject The concluding chapters on the inheritance of mental endowments, including a section on racial psychology, are marked by a welcome sanity and restraint

There is, however, one feature of the book that appears to us frankly regrettable This is the firm conviction that various toxic substances may directly produce changes in the germ cells Alcohol, quinine, mercury, iodine, arsenic, and lead are all mentioned In particular, the evidence for a directly injurious effect of alcohol upon the germ cells is summarily treated, those results that would appear to deny the reality of any such effect being mentioned only to be rejected It would be absurd to claim that any final answer can be pronounced at the present time, but it is undoubtedly the case that the consensus of scientific opinion is that radium and x rays are the only agencies that have been proved to cause direct germinal change

The sense of the original seems to be well rendered, but it could not be claimed that the translation is graceful One wonders whether Professor Lenz actually intended to say that he " really must warn my Jewish fellow-citizens that they should not get the wind up " We cannot conclude without expressing our opinion that the English translation of this work is very welcome, that it is an inspiring and useful volume, and should be widely read

LETULLE'S PATHOLOGICAL ANATOMY

A few weeks before his death Professor MAURICE LETULLE completed the manuscript of his great work on pathological anatomy and confided it to his son, M Raymond Letulle, and Dr Normand, the conservator of the museum, for publication This duty has now been performed under the editorship of Professor Nattan Larrier Two additional articles, on the blood and the eye, by Drs Jacquelin and Duclos respectively, are included, but otherwise no alteration has been made in the original text

The issue of the three handsome volumes[2] must be considered an important event in the literature of pathological anatomy Not only is the book original in design in some important particulars but it embodies conclusions reached at the close of a period of fifty years of study and experience in teaching It is in no sense a compilation, but a record of prolonged personal observation From the first Professor Letulle collected and preserved innumerable macroscopical and microscopical preparations for study and comparison, and his book, based on these, is to be regarded less as a mere textbook than as the record of a prolonged research in pathological anatomy, and on that account it will be of enduring value The general plan of the work does not differ from that usually adopted , a consideration of the processes included under general pathological anatomy is followed by that of the special anatomy of the organs But originality of treatment and the personal element are manifest on every page It was the author's opinion that the teaching of pathological anatomy should consist of something more than a string of formal statements, as is often the case it should on the contrary, aim at building up in the minds of students distinct mental pictures of the various pathological changes in organs and tissues and be made as far as possible pictorial His extensive pathological collection rendered this possible in the case of his teaching but the same feature is met with in his writing His descriptions always skilfully drawn and abounding in detail, give the impression of being direct transfers from the specimens described and they appear, therefore to have much of the value of direct observation It would be difficult to name

[2] *Anatomie Pathologique* Par Maurice Letulle Avec la collaboration de L Nattan Larrier et de MM Jacquelin L Duclos et E Pinard Normand Tomes I II et III Paris Masson et Cie 1931 Pp 2 346 843 figures Paper cover 525 fr boards 600 fr , the three volumes not sold separately)

another work on pathological anatomy in which this valuable quality is so distinctly in evidence.

The descriptions are aided and enforced by a large number of very beautiful illustrations, such as one is accustomed to find in medical works issued from the French press. These, taken from specimens in Professor Letulle's extensive collections, may be safely accepted as being especially typical of the points illustrated. More particularly the large series of microscopical illustrations will be found to be of unusual value. No bibliography is included in the work. In these days bibliography has almost become a separate science, and, in fact, has itself given birth to a subsidiary science—that of indexing. These subjects are therefore to be looked for elsewhere; but in the present instance a bibliography seems hardly called for, considering the preponderatingly personal quality of Professor Letulle's work. Letulle's *Anatomie Pathologique* will be an ornament in every medical library and a valued "stand-by" to all those interested or engaged in that study.

POLIOMYELITIS

The little work on Poliomyelitis,[3] by Dr. PAUL DUHEM, is based on his ten years' experience of the disease at the Hôpital des Enfants-Malades in Paris, where he occupies the position of electro-radiologist. After short introductory chapters dealing with the history and etiology of the disease, he discusses in detail the clinical aspects, which he divides into the six stages of incubation, febrile period, post-febrile stage, period of paralysis, period of regression, and period of permanent paralysis. Then follows a chapter on the study of the electrical reactions of the muscles and nerves, the importance of which, from the prognostic and therapeutic as well as from the diagnostic standpoint, is especially emphasized. The morbid anatomy and clinical varieties of the disease are then considered, and after a short chapter on prognosis a detailed description is given of the treatment of the disease according to its various stages, special stress being laid on the necessity of a systematic method in carrying it out.

The first three issues of *Immunität, Allergie und Infektionskrankheiten*,[4] which are devoted to infantile paralysis, contain nine essays by German, British, and American authors, which give a useful summary of our present knowledge of the disease. Professor CLAUS W. JUNGEBLUT and Dr. RICHARD THOMPSON of Columbia University, New York, contribute an essay on recent investigation which is chiefly concerned with etiology, active immunization, and serum therapy. The statistical aspects are dealt with by Dr. E. ROESLE of Berlin, who provides tables of the incidence and mortality of poliomyelitis in Prussia, England, the United States, Scandinavia, and Switzerland, as well as the age and mortality distribution of cases. A report of the 1930 epidemic in Alsace is contributed by Drs. C. LEVADITI, E. SCHMUTZ, and L. WILLEMIN, based on that given last December to the Académie de Médecine of Paris. Dr. DE RUDDER of Würzburg writes on the early diagnosis, Dr. A. LICHTENSTEIN of Stockholm on abortive attacks, Dr. P. BAMBERGER of the Greifswald University Children's Clinic on the clinical aspects and general treatment, Dr. R. W. FAIRBROTHER of the department of bacteriology and preventive medicine of Manchester University on serum therapy, Professor HANS SCHLOSSBERGER of the Berlin Health Office on treatment by convalescent serum in Canada, and Dr. P. PITZEN of Giessen on the indications and results of orthopaedic treatment.

THE PHILOSOPHY OF TREATMENT

In his *Modern Therapeutics of Internal Diseases: an Introduction to Medical Practice*,[5] Dr. CAWADIAS makes an earnest and eloquent appeal for the adoption of scientific principles in medicine. Thus at the outset he discusses at some length the fundamental concepts of medical science on which the treatment of internal diseases is based; internal diseases must be regarded not as limited to one organ, but as manifestations of a profound disturbance of the whole body, and hence specialties, such as cardiology, neurology, and gastro-enterology, based on the erroneous dogmas of the last century, especially that of localization of disease, can no longer be accepted. Young physicians who propose to specialize in one group of diseases are warned that they are on a false route. This change of view is due to the labours of synthetic physicians, including Sir James Mackenzie, "probably the greatest clinical leader of neo-Hippocratism in England," of physiologists who showed that man is an integrated whole, of constitutionalists with their insistence on the influence of heredity, and of modern psychologists. Diseases are artificial categories, the term being employed for convenience, for in truth the only reality is the patient. As treatment depends on diagnosis, the first phase of treatment is diagnosis, and this must be efficiently carried out before that of therapeutics, the second phase. Effective diagnosis is incompatible with the narrow specialist outlook, and must first be made on clinical examination, and then confirmed, corrected, and controlled by laboratory methods.

The various stages of diagnosis are described, and then the author comes to the use of therapeutical agents in internal diseases; in doing so, insistence is laid on general principles, which are illustrated by examples. But the reader must understand that this philosophically written book is not on the lines of an index of treatment which provides in the briefest compass a list of remedies, ancient and modern, for a given disease. In a special chapter on "the modern internist" the properties that go to make up "the ideal physician" are set out, and the value of classical education is illustrated by a reference to Osler and Allbutt. It is a book for the thoughtful rather than the hurried practitioner.

MUSCLE INDURATIONS

In his book on muscle indurations (muskelhärten or myogelosen)[6] Dr. MAX LANGE is treading on unfrequented ground. The hybrid term "myogelosis" is of recent origin. It does not appear under its German pseudo-Greek form in Guttman's *Medizinische Terminologie* of 1927, but Dorland's *American Illustrated Medical Dictionary* of 1929 contains the following: "Myogelosis, μυς muscle + gelare, to freeze. An area of hardening in a muscle." Dr. Max Lange says that nobody doubts the existence of pains in the muscles which are attributed to so-called rheumatism, but their cause and mode of production are in most cases unknown to the doctor. In

[5] *The Modern Therapeutics of Internal Diseases: an Introduction to Medical Practice*. By A. P. Cawadias, O.B.E., M.D., M.R.C.P. London: Baillière, Tindall and Cox. 1931. (Pp. xii + 148; 3 figures. 10s. 6d. net.)

[6] *Die Muskelhärten (Myogelosen)*. Von Privatdozent Dr. Max Lange. Lehmanns medizinische Lehrbucher, Band xii. Munchen: J. F. Lehmann. 1931. (Pp. 194; 86 figures; 4 plates. M.12.)

Germany the popular opinion is expressed in the rhyme: "Und was er nicht erklären kann, Sieht er als Rheumatismus an!" which may be rendered, "The pains they can't explain at all, The doctors rheumatism call!"

The problem of the causation of so much suffering as is represented by the terms myositis, muscular rheumatism, fibrositis, lumbago, sciatica, etc., calls for solution. The most important question connected with it is: Are there in the affected muscles any objective changes demonstrable as a probable cause? The kind of treatment depends very much on the answer. It is a question that has been long answered negatively in the medical schools and only positively by a few practitioners who have been occupied in the study and practice of massage. Muller of Gladbach, Schade, Fritz Lange, and Everbusch have of recent years brought forward evidence of changes in the muscles. These changes are called by Schade and F. Lange muscular indurations (muskelhärten or myogeloses). Masseurs and physiotherapeutists have long been familiar with painful indurated spots in muscles, and have with justice claimed to relieve pain by dispersing or at least softening such indurations. In our issue of May 2nd we noticed Dr. Meynell's book on *Backache*, in which sensitive deposits of this kind are referred to, and their importance and their successful dispersal by manipulation described. Such indurations, according to Dr. Lange, are to be found most often in certain specified spots, which he represents in a number of illustrations, in various parts of the body. In the absence of histological evidence of the exact nature of these indurations, attempts have been made to measure and record the surface resistance and degree of elasticity of muscles by means of the sclerometer of Dr. Mangold, for which constant results are claimed to be recorded. Myogelosis is not only present in so-called muscular rheumatism, but it also follows overstrain and overuse of muscle, and may be the result of disturbances of metabolism.

Professor Fritz Lange, who contributes a preface, looks forward to great gains from the further study of myogelosis. He attributes to the orthopaedic clinic in Munich the attainment of much progress in gelotripsy or dispersal by rubbing during the last ten years, but thinks that it will take another ten years to familiarize practitioners with the method of treatment, and to bring it into general use. By that time the conditions in question will no longer be treated with anti-neuralgic and anti-rheumatic drugs, but cured by searching out and dispersing myogelotic deposits. This book is suggestive and the subject well worth further examination.

NOTES ON BOOKS

Interest in the intestinal protozoa of man has been greatly stimulated in the last fifteen years, and a considerable body of information has accumulated. It is with the object of making this information available to the general medical practitioner and diagnostician that *Protozoan Parasitism of the Alimentary Tract*,[1] by K. M. LYNCH, has been prepared. It opens with a general introduction to the subject in which the author insists on the need for careful diagnosis of forms found in the faeces, and for evaluation of the pathogenic effect of such species as are found. Only a relatively small number of the intestinal protozoa are known to be harmful to man; a few others may possibly be so regarded when we know more about them; many are definitely harmless. In the following pages the author considers the protozoa which have been reported from the human intestine, species by species, and discusses their relationship to disease, bionomics, and treatment. The book, which is somewhat expensive for its size, will be of more interest to those who live in warm climates than to practitioners in this country.

An English translation of the second edition of Dr. PLACZEK'S *Sexual Life of Man*[2] has recently appeared. The aim of the work is to supply the medical student, practitioner, and jurist with an up-to-date description of human sexual life in its normal and pathological aspects. The first part, therefore, is an anatomical and physiological introduction which includes an account of the external and internal sexual organs in both sexes, with their muscle and nerve supply, the sexual life of the child, and the outward manifestations of puberty. Genital gland deficiency in both sexes and the relations between the genital apparatus and the endocrine glands are then considered. Succeeding chapters deal with the sexual impulse and its various quantitative and qualitative anomalies. A bibliography of almost exclusively German works is appended.

The little work on *The Alcohol Habit*,[3] by Dr. WALTER E. MASTERS, is written mainly from the voluntary home treatment point of view, the writer having been closely associated with the late Dr. Francis Hare. It is divided into eight chapters. The first three deal with the historical aspects, reaction of the body to alcohol, and the predisposing causes of alcoholism, and are followed by chapters devoted to a discussion of the various types of alcoholism according to Hare's classification, their symptomatology, treatment, and prognosis. As Dr. Masters is a barrister-at-law, special importance attaches to Chapter VII, which deals with legal considerations relating to drunkards and drunkenness. There are two appendices, the first on alcohol and longevity, and the second giving the percentage of proof spirit and of absolute alcohol in various beverages.

[3] *The Alcohol Habit and its Treatment.* By Walter E. Masters, M.D., M.R.C.S., D.P.H. London: H. K. Lewis and Co., Ltd. 1931. (Pp. xvi + 190. 6s. net.)

PREPARATIONS AND APPLIANCES

SPRAY ADAPTOR FOR TANNIC ACID

The Crookes Laboratories (Park Royal, N.W.10) have devised a simple apparatus for the immediate application of tannic acid to burns, thereby preventing the absorption of toxic substances, alleviating the pain, and thus minimizing the shock. The objection that freshly prepared solutions of tannic acid must always be used has been surmounted, it is stated,

by the employment of a stable 2.5 per cent. solution which is stored in sealed ampoules, ready for attachment to the bellows and spray. When this treatment is required for burns, of the face, the eyes must be protected. The spray adaptor is supplied complete in box with bellows and one ampoule containing an ounce of the colloid tannic acid solution for 7s. 6d.; a box of six ampoules costs 5s.

EPIDEMIC SORE THROATS

If an illustration were wanted of the advance of medicine step by step by the process of analysis, differentiation, and definition, it would be very natural to take that of the acute infectious anginas. There is a fascinating story of scientific endeavour at every one of the stages which in this case led to the nomenclature which we have now made our current coin and use daily for working purposes: for example, in the history of the separation of diphtheria, first clinically and then bacteriologically ; in the dissociation of scarlet fever from other forms of acute tonsillitis ; and in the subdivisions which we now habitually make of the latter. Familiar terms such as diphtheria, scarlet fever, acute tonsillitis, follicular tonsillitis, and Vincent's angina have long been stabilized, and it is in reliance on their stability that we habitually base many inferences derived from notification returns and statistics of sickness, as well as the action taken in individual cases and outbreaks. It is, however, useful occasionally to put a nomenclature to the test of its correspondence with present-day facts, and guard against too great a dependence on tradition. One may, for example, inquire with advantage how far the clinical pictures and syndromes which were formerly implied by the term scarlet fever are recognizable to-day, whether recent developments of pathological and bacteriological knowledge give support to the former clinical differentiations, or the reverse, and whether the different anginas which we so conveniently label do habitually breed true?

Some useful material for such inquiries was furnished at the Eastbourne Meeting of the British Medical Association by the communication made by Dr. J. A. Glover and Dr. Fred. Griffith to the Section of Public Health, which appears elsewhere in our present issue. The data they presented are of a kind which cannot often be obtained, and for which grateful acknowledgement should be made, not only to the investigators themselves, but to the committee of the Medical Research Council, and to the authorities of the public schools, who made the inquiries possible. The outbreaks investigated show an almost inextricable dovetailing between scarlet fever and other infectious sore throats and febriculas in these communities. Their interdependence has been tested school by school and term after term, and checked by the evidence of immunity gained with the progress of time. In some instances the existence of the preceding infection, whether "scarlatinal" or not, was hardly observable until it was followed by what appeared to be epidemic otitis media, and the authors associate the occurrence of outbreaks of rheumatic fever in schools with similar preceding sore throat epidemics. Starting from the hypothesis that all the initial throat infection can be attributed to haemolytic streptococci, they envisage the subsequent cropping up of scarlet fever, otitis media, or rheumatic fever in greater or less proportion as all being possible results of that infection. The particular factors which determine the occurrence or preponderance of one or the other must necessarily be complex, but the bacteriological studies made of the cases and carriers point to the consequences in the particular instance being in large measure determined by the particular serological types of haemolytic streptococcus which were dominant in the original outbreak or which became dominant as it progressed.

The actual number of cases in the communities studied is not great, but the thoroughness and intensive nature of the observations recorded will convince the reader that it is very desirable that they should be repeated and extended as far as possible. The investigation is of more than academic interest. Work on such lines may well point the way to simplification and economy in the management of epidemics in schools. It should also do something to help in the establishment of scientific principles of selection of cases for hospital isolation. And, in the field of immunization, it encourages a hope in the possibility of producing active immunity, not merely against uncomplicated scarlet fever, but at the same time against a group of other affections creating still more extensive morbidity.

THE EMERGENCY BUDGET

The great war left a legacy of many problems and difficulties, and those which were slowest in achieving recognition are likely to prove the most difficult to solve. Prominent among such questions are those of international finance. Where long-term loans are concerned this country has been in a fairly strong position, and has adopted a very reasonable, if not actually generous, attitude to its debtor nations ; the position with regard to short-term loans, on the other hand, has never been free from risk of difficulty, and at last has proved to be fraught with real danger. It is a commonplace that we have to buy largely from other countries, and in the long run must somehow provide foreign credits to meet our foreign debts. In pre-war years such debts were incurred almost entirely for food and raw materials, such as cotton, rubber, metal ores, etc. During recent years our foreign monetary liabilities have been increased by payments for interest due by our Government, and our imports have expanded rapidly, overlapping the former field and covering heavy purchases of foreign goods of luxury or pleasure-giving utility and the artificially stimulated exports of debtor countries which have a lower level of manufacturing costs and, in some cases, a depreciated international exchange. Such causes have contributed to an aggravation of the difficulty of effecting a settlement of foreign debts in foreign currencies. The ordinary method of facilitating such settlements is by means of foreign short-term loans, which enable a foreign trade debt to be discharged at the due date, the ultimate liability

being in suspense until the creation of trade credits abroad—for example, by exports or by shipping or banking services—allows it to be finally cancelled. As a fact, such means of cancellation have been decreasing, so that there has been a tendency for the foreign short-term loan liability of this country to increase.

One fact which has been abundantly proved during the past few years is that if a nation's exchequer spends more than it receives in revenue, foreign investors, including holders of short-term debts, become nervous of a depreciated exchange, with a resulting difficulty on the part of the borrowers in meeting obligations in a foreign currency. If such nervousness becomes general with regard to the liabilities of a particular country, no more is needed to create a sudden demand for repayment of the loans, and failure to meet such a demand would precipitate a financial crisis, foreign exchange rates would become onerous in the extreme, and in the case of a country which *must* import from abroad, every member of the community would be very seriously affected. It seems clear that we have for some time been drifting towards that position, and that the publication of the May Report, by its candid statement that the national exchequer was spending more than it was receiving, sounded the alarm among the financial concerns which hold our short-term liabilities. Immediate and drastic steps were necessary if a general calling in of that financial accommodation was to be avoided. On previous occasions when this country has taken part in an effort to save another nation from a similar calamity, a primary condition has been laid down that the national expenditure and revenue should be balanced as quickly as possible. Now it is our own turn to meet that condition.

That is the genesis of the new emergency Budget; how is the equilibrium to be restored? Our political leaders have pooled their influence and ability to meet the emergency, and we may confidently look for a statesmanlike and courageous solution, but the nature of the governing body excludes solutions which would be held by some of its members to be a contradiction of the principles which they regard as essential to the proper development of this country. Hence tariff reform and some other possible and widely supported solutions would seem, at the moment, to be impracticable, perhaps the more so as time would be required to develop the appropriate machinery, and promptitude is essential. In the main, therefore, Mr. Snowden has proceeded along the line of stiffening existing taxes and cutting down existing expenditure. But though the new Budget contains no novel taxes it is by no means devoid of dramatic announcements, such as that our total national and local taxation is very near one-third of the total national income, or that the contemplated deficit on next year's Budget is £170,000,000 as compared with the figure of £120,000,000, which has been the basis of recent discussions in the press and elsewhere. Faced with figures of such magnitude the new Government has cast its fiscal net far and wide. Income tax is to be increased, not merely in rate, but also by a reduction in the amounts of income which are exempted and are relieved of half the rate of tax, and as a further turn of the screw the allowances in respect of children are to be somewhat reduced. The existing surtax is increased by 10 per cent., but the lowering of the exemption limit, which was freely foretold in the press, is not, in fact, proposed. Two minor modifications of the increased burden are to be given. The relief to earned incomes is increased from one-sixth to one-fifth, and existing rates of depreciation are to be subject to an additional one-tenth. On the latter part of the proposals we would have liked a little further light. Under present rules medical practitioners receive, say, 15 per cent. depreciation allowance in respect of their cars; apparently in future they will receive 15 per cent. + 10 per cent. of 15 per cent. = 16½ per cent. in all—a small advantage, but helpful as far as it goes. But when a car is replaced a claim for obsolescence allowance is normally made, and a deduction is given equivalent to the unexhausted value of the car less the sale price. In future—that is, in 1932–33 and onwards—rather more will be given year by year, and therefore rather less will constitute the unexhausted value, so that the extra depreciation will be compensated for by a reduced obsolescence allowance, and in the long run the taxpayer gains no advantage. A manufacturer who uses expensive plant may perhaps feel some gratitude for this rather diminutive bird in hand, but it seems almost valueless to the medical practitioner. An additional income tax is by no means the only burden laid on him; the increase in the petrol tax will be a real burden in most cases, especially in the case of those carrying on rural practices; while behind the scene now staged preparations are actively going on for the second scene, in which he will again appear, as the victim of a cut on his panel fees, so that the drama as a whole will leave him with a reduced income, and an increased fiscal contribution to make therefrom.

The Budget was intended, apparently, to touch everyone who could possibly bear increased taxation without altogether unreasonable hardships, but we doubt whether any section of the community will be called upon to make heavier sacrifices than the members of the medical profession, and in particular those whose income is mainly or largely derived from practice under the National Health Insurance Acts.

INTERNATIONAL LIST OF THE CAUSES OF DEATH

Nosology, including the nomenclature and classification of diseases, attracts little attention now as compared with the eighteenth century and the early years of the nineteenth, when, under the influence of Linnaeus, a number of elaborate classifications of diseases were brought out by Linnaeus (1735 and 1763), Vögel of Göttingen (1764), William Cullen (1769 and 1785), MacBride of Dublin (1772), Pinel (1798), Thomas Young (1813), John Mason Good (1817), and others. The classification and nomenclature of diseases, which mainly interest those in charge of vital statistics, are

usually brought to the notice of medical practitioners by the authorities in connexion with certificates of death. Writers of textbooks also find some difficulty with the problems of nosology and classification, for the constant advance of knowledge and changing opinion render alteration in the arrangement of their subject-matter a recurring duty. It must in fact be frankly admitted that an ideal and final classification of diseases will not be possible for a long time, and much the same holds good with regard to nomenclature. Many attempts have been made to obtain such a degree of uniformity in these respects that the statistics of mortality and morbidity in various parts of the world can be intelligibly compared. Though in 1855 William Farr, our greatest medical statistician, and Marc d'Espine of Geneva tried to make this possible, it was such a thorny proposition that as late as 1893 no two countries in the world employed precisely the same forms and methods for the statistical classification of mortality. In that year, however, this want was supplied, largely as the result of the energy and perseverance of the late Jacques Bertillon (1851–1922), Chef des Travaux statistiques de la Ville de Paris, the son of Louis Bertillon, the statistician, and brother of Alphonse, the French pioneer in anthropometry. The French Government convened international conferences in 1900, 1909, 1920, and 1929 for the decennial revision of the International Nomenclature of Diseases (Causes of Death and Incapacity) in order to facilitate the procedure in nosological statistics. It is a well-deserved tribute to Bertillon that on the title-page of the 1930 edition of the international list the words " Classification Bertillon " come in brackets after "statistiques nosologiques." A *Manual of the International List of the Causes of Death*, as adapted for use in England and Wales, was brought out by the Registrar-General in 1912, and in 1926 a second edition for use not only in England and Wales, but also in Scotland and Northern Ireland, appeared. The present and third edition of this manual[1] is based on the fourth decennial revision (1930) resulting from the conference held in Paris on October 16th to 19th, 1929, under the presidency of Professor G. H. Roger, dean of the Paris Faculty of Medicine. As compared with the second edition it contains ten pages more of introductory matter, including, among other subjects, " Suggestions to medical practitioners respecting certificates of causes of death and form of medical certificate," issued by the Registrars-General of England and Wales, Scotland, and Northern Ireland. The form of death certificate in use in England and Wales was remodelled and came into operation on July 1st, 1927 ; it is almost identical with that subsequently recommended by the Commission Mixte de Statistique Sanitaire of the International Statistical Institute, and adopted by the Institute at its session at Cairo in 1928. It has not, however, been adopted in Scotland or Northern Ireland; attention is also drawn to other differences in the official procedures in the various parts of the United Kingdom. It may be noted that this manual is concerned with the causes of *death*, and is quite distinct from the *Nomenclature of Diseases* brought out by a joint committee of the Royal College of Physicians of London in 1869, 1884, 1896, 1906, 1918, and now again in the press, Drs. Robert Hutchison and W. C. Bosanquet being the chairman and secretary of the committee.

[1] *Manual of the International List of the Causes of Death*, as adapted for use in England and Wales, Scotland, and Northern Ireland. London. H.M. Stationery Office. 1931. (3s.)

MAGGOTS AND OSTEOMYELITIS

In the July number of the *Journal of Bone and Joint Surgery* there appeared a posthumous article by Dr. William S. Baer of the Johns Hopkins University, Baltimore, Maryland, under the rather arresting title of " The treatment of chronic osteomyelitis with the maggot (larvae) of the blow-fly." Dr. Baer's original paper was read before the annual meeting of the American Orthopaedic Association in June, 1930, but his illness and untimely death on April 7th of this year prevented his preparing it for publication ; this has been done by his associate, Dr. George Bennett. Since the days of Ambroise Paré, and very likely before then, observations have been recorded of the healthiness of wounds infested with maggots, and in the American War of Secession one Southern surgeon seems—according to Dr. Baer—to have used larvae therapeutically. Dr. Baer's attention was drawn to the subject by the discovery in France during the late war of two soldiers who had been missing for days, whose wounds were crawling with maggots. Although these two men had compound fractures of the femur and large wounds of the scrotum and abdomen, and although they had lain on the ground with their wounds undressed for seven days, their condition—so far as infection was concerned—was excellent. This experience set Dr. Baer thinking, and when he was once more able to carry on investigations at Baltimore, he set to work to study the question, and, as far as possible, to reproduce the conditions experimentally. It was found that the naturally grown larvae of the blue- and green-bottle flies could not safely be employed, as they might have contained pathogenic micro-organisms or spores. Careful and repeated experiments showed that their eggs could be cultured and obtained free from all infection, and that such larvae could be kept alive and active in wounds for at least five days before they pupated. The paper contains reports of eighty-nine cases thus treated, and Dr. Baer's conclusions were as follows: " (1) Maggots have been found to be a tremendously useful adjunct to thorough surgical treatment of chronic osteomyelitis, and, in our opinion, are *far more successful in securing permanent healing of these extensive wounds than any other method tried by us.* [The italics are ours] (2) Maggots, by their digestive action, clear away the minute fragments of bone and tissue sloughs caused by operative trauma in a way not accomplished by any other means. This is a tremendously valuable asset in the healing of a wound. (3) Maggots cause wounds to become alkaline, and in this way diminish growth of pathogenic bacteria. (4) Maggots seem to have other more subtle biochemical effects within the wound itself, and perhaps cause also a constitutional reaction inimical to bacterial growth. This is under investigation. (5) Maggots as raised and sterilized in the manner described may be used in any wound without risk to the patient. (6) The post-traumatic or post-operative general condition of the patient is better in maggot treatment than in the older forms of treatment where infection was combated by chemicals or other types of dressing. There is less absorption and less toxic

reaction (7) In open tubercular abscesses, with or without secondary infection, wide exposure followed by maggot treatment has proved surprisingly effective in a number of cases, and will be given further trial" This paper, coming from such an authority, and supported by such an amount of carefully stated evidence, must attract attention, and further reports will be awaited with interest Meanwhile, another innovation in the treatment of osteomyelitis has been tried in the United States and appears to be gaining in popularity In *Osteomyelitis and Compound Fractures and other Infected Wounds* (reviewed in the *Journal* of September 21st, 1929, p 540), Dr Winnett Orr of Lincoln, Nebraska, strongly recommended free exposure, fixation in gypsum, and very infrequent dressings, paying no heed to any fetor of discharge A report by Dr Jacob Kulowski on this treatment of the disease and of allied suppurative processes, published in the issue of the *Journal of Bone and Joint Surgery* referred to above, deals with 155 cases, and the conclusions arrived at are very favourable Osteomyelitis is doubtless more common in the United States than in this country, and these attempts to find new, safer, and shorter methods of treatment indicate that surgeons are not satisfied with routine measures Neither of those described will be readily welcomed by surgeons brought up to abhor fetid discharges, and larvae of all kinds, but if further experience reveals that they offer real advantages to the patient, they are bound to be adopted at all aesthetic costs

LIMITATION OF TRAFFIC IN NARCOTIC DRUGS

The new Convention dealing with the traffic in narcotic drugs, drafted by the international conference which sat from May 27th to July 18th, has now been published, if it is ratified and put into force, it will modify, in several important details, the Hague Opium Convention of 1912 and that of Geneva of 1925 As intimated in the *Journal* of July 18th the proposal favoured by the London Conference of 1930 and by the Opium Advisory Committee of the League of Nations, to allocate to manufacturing nations quotas of the ascertained world requirements of morphine and cocaine and their derivatives was rejected An alternative plan, advocated by the Japanese and French delegations, was adopted by 27 votes to 3, with 6 abstentions The president of the conference, M de Brouckere of Belgium, felt some anxiety at this decision not because the alternative system which was adopted was bad, but "because it would be very difficult to apply" The alternative adopted provides that each nation shall furnish annually to the Central Opium Board estimates of its medical and scientific requirements for each of the drugs, for internal consumption, for export, for conversion, and for reserve or Government stocks Manufacture is to be limited to such annual estimates The Convention is claimed to cover "all known and possible derivatives of opium and coca leaf" which can give rise to addiction The export of heroin, except to Governments and under specified conditions, is forbidden Codeine and dionin are now to be brought under control The annual national estimates will be published in summary by the Central Board, along with any explanations furnished by any contracting party which is deemed to have failed in its obligations The Central Board will be assisted by a supervisory body composed of representatives of the Opium Advisory Committee, the Central Board, the Health Committee of the League, and the Office International d'Hygiene Publique Each nation is to set up a special administration to give effect to the Convention and is also invited to consider the desirability of establishing a State monopoly for drug manufacture This last suggestion was opposed by the German Government The Convention is not to come into force until it has been ratified by twenty five States, including four of the following France, Great Britain, Germany Japan, Netherlands Switzerland, Turkey, and the United States In the Final Act attached to the Convention estimates are furnished of the present annual world requirements of morphine, heroin, and cocaine, these are given respectively as nine tons, two tons, and five and a half tons

MEASUREMENT OF NOISE

Some time ago reference was made (*Journal*, 1930, ii 920) to the important conclusions reached by the Noise Abatement Commission of the Department of Health, New York They were subsequently confirmed by Dr G W C Kaye, the superintendent of the physics department of the National Physical Laboratory at Teddington, who gave a highly interesting account of his work on noise and its measurement in a Friday evening lecture at the Royal Institution, London, this summer It is encouraging to learn that the Middlesex County Council is seeking powers next session to deal with excessive, unreasonable or unnecessary noise It would require too technical a disquisition to explain how noise is measured and by what processes of experiment and reasoning the unit of noise has been determined It will suffice here to note that New York and London have agreed upon the decibel as the unit thus commemorating that distinguished inventor Alexander Graham Bell the originator of the telephone Experiment shows that one decibel corresponds approximately to the least perceptible change in loudness of a sound of medium loudness under average conditions, and that for pure sounds of medium frequency the range of audibility between the thresholds of hearing and feeling is covered by 130 decibels In the case of sounds of different or mixed frequencies neither the physical intensity level nor the sensation level can be used as a measure of loudness Dr Kaye continues "In the circumstances an arbitrary scale has to be adopted as a practical standard, and a suitable one for the purpose is the sensation scale of a pure note having a frequency in the region of 1 000 cycles per second Then the loudness of any sound, whether pure or a mixture such as a noise is defined as the sensation level (expressed in decibels above the threshold value) of the standard note which appears equally loud to the ear" This explanation will give some intimation of the difficulties of the subject Even in the case of very loud sounds the amount of energy concerned in their emission is small Dr Kaye tells us that the noise of a cup tie crowd at Wembley all the members talking loudly would provide enough energy to boil a cup of tea! The worst noise yet to be found in the cabin of a noisy aeroplane—recorded as 100 decibels At the other end of the scale 10 decibels connotes a quiet whisper five feet off Other values are very busy traffic in New York 75 decibels, in London

70 decibels. A tram on very noisy rails in London registered 90 decibels, while the interior of a London tube train varied between 75 and 80. The New York subway trains seem to make a quantity of noise which is *sui generis*, and to attain almost to the bad eminence, in this respect, of the aeroplane. Masking effects of noise—that is to say, the extinction of one sound by another equally loud or louder—have been used as a means of measurement. In New York, when Lindbergh was being welcomed after his Atlantic flight, a brass band not many yards distant was inaudible. The apparently inoffensive "clicker" used by lecturers to signal to lantern or cinema operators has a terrible power of penetration. Dr. Kaye says that it can be heard a thousand feet away. He has used it for rough experiments on noise measurement. In an aeroplane cabin, or close to a pneumatic road-breaker, its audibility falls to two or three feet. The much harassed railway companies may take some small comfort from the statement that an aeroplane in a cross-Channel flight was found to be a thousand times noisier than an express train. It is, however, discouraging to learn that putting cotton-wool in the ears only reduces aeroplane noise from 100 decibels to 90; but perhaps these 10 decibels may be the most offensive ones. There are still difficulties to be foreseen in the legislative control of noise, and more may be hoped from persuasion than coercion, especially when we reflect that some of its most objectionable features are due more to pitch, intermittency, and suddenness, than to the actual energy employed, or to the amount of the noise. The now happily silent cab whistle was to many people one of the most nerve-racking sounds, yet it was not so very large or loud a noise as some less aggravating ones. The barrel organs, also, which drove John Leech and many another sufferer to desperate protest, were not in themselves so deafening. At least, motor horns, the obvious purpose of which is to make the pedestrian jump, should be sternly suppressed, for by confusing him they are apt to defeat their own ends. It is alarming, however, to learn from Dr. Kaye that amplifiers have been produced which make the human voice clearly audible at a distance of two miles. Thus are the resources of science prostituted to base uses, while those to whom we look for help may add to our sufferings.

FOOD POISONING

The marked advance during recent years in our knowledge of illness ascribed to food infection may be attributed in general to an awakened interest in food and all that concerns it, and in particular to the careful investigations of outbreaks of food-borne disease carried out by observers mainly in this country and in the United States. These valuable researches have solved some problems and shown that others, believed to be solved, still await solution. The facts should be known to those who have to deal with outbreaks of food poisoning but who may not have access at first hand to the sources of information. The whole position as it stands to-day is most usefully summarized in a recent work[1] by Dr. E. O. Jordan of Chicago, which extends and brings up to date his previous book on food poisoning (reviewed in the *Journal* of July 28th, 1917). In the early chapters he discusses allergy and the poisonous plants and animals, including mushrooms and the mussel poison. Under the metallic poisons he largely exonerates tin, zinc, and aluminium. A good account is given of preservatives in food, the English Preservatives in Food Regulations being cited. The milk-borne infections are fully described, and illustrative outbreaks quoted. The section on Salmonella food poisoning is informative, though the terminology is not that usually employed in this country. The metazoan parasites are also considered, and the facts relating to botulism are amply detailed. The whole field is covered without waste of words, adequate references being given in the various sections.

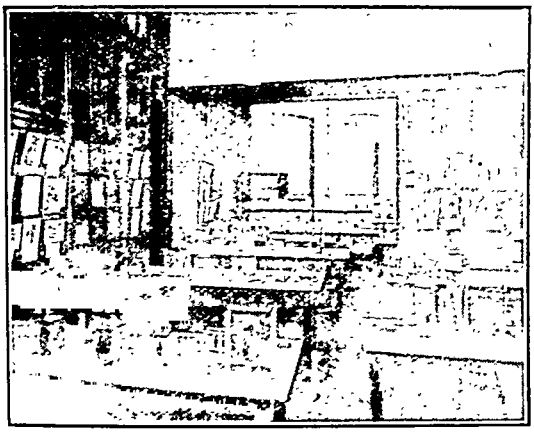
EXPERIMENTS ON ANIMALS

According to the Home Office annual return,[1] 450,822 experiments were performed on living animals during 1930, being 47,681 more than in the previous year. Of this number 8,252 were performed under licence alone, or under Certificate C, and therefore came within the provision of the Act, which says that the animal must be completely under the influence of an anaesthetic throughout the whole of the experiment and be killed if it has suffered any serious injury, or if the pain is likely to continue after the effect of the anaesthetic has ceased. In addition, 1,051 operations were conducted under Certificate B, or under B linked with EE or F. In no case was a certificate dispensing entirely with the use of anaesthetics allowed for an operative proceeding more severe than subcutaneous venesection. Serious operations were always required to be performed under an anaesthetic. The great majority of the experiments (430,063) were conducted under Certificate A, which is granted only for procedures attended by little or no pain—for example, inoculations, hypodermic injections, feeding experiments, administration of various substances by the mouth or by inhalation, or the abstraction of blood by puncture or simple venesection. In a very large number of these experiments the results are negative, and the animals suffer no inconvenience whatever. The returns show that during the year under review 25,259 experiments were made in the course of cancer investigation—1,295 under an anaesthetic and the remainder without. The latter were almost entirely inoculations into mice, or exposure of animals to radiation. A large number of experiments, mostly simple inoculations, were performed either on behalf of official bodies with a view to the preservation of the public health, or directly for the diagnosis and treatment of disease. The report is signed by Dr. J. A. Giles, chief inspector. The advisory committee appointed by the Home Secretary to assist him with advice in the administration of the Act now consists of Lord Tomlin (chairman), Dr. H. Morley Fletcher, Sir Archibald Garrod, Sir William Hardy, Sir Arthur Keith, Sir D'Arcy Power, and Sir Charters Symonds.



Sir George Newman's report as Chief Medical Officer of the Ministry of Health, for the year 1930, entitled "On the State of the Public Health," is published this week by H.M. Stationery Office (4s., by post 4s. 3d.). Many of the subjects dealt with in this document are of great importance, and reference to them will be made in forthcoming issues.

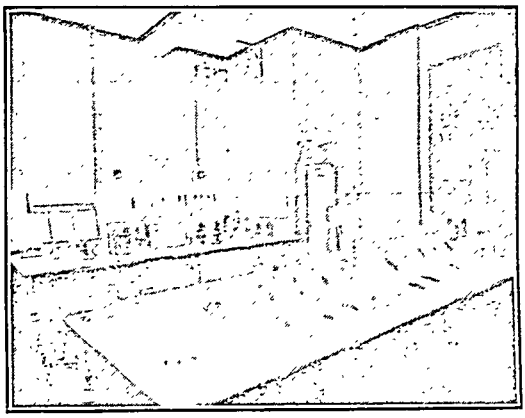
THE PATHOLOGICAL MUSEUM AT EASTBOURNE

We have received from Dr. A. Geoffrey Shera, chairman of the Museum Committee of the Eastbourne Annual Meeting, the following illustrated account of the Pathological Museum, supplementing the article published in our issue of August 8th (p. 255).

The photographs reproduced herewith show four of the eight rooms in the Technical Institute at Eastbourne, where the Pathological Museum was held. It is hoped that these photographs may be of assistance in the future to those who have the task of organizing the British Medical Association museum, from the point of view of general lay-out.

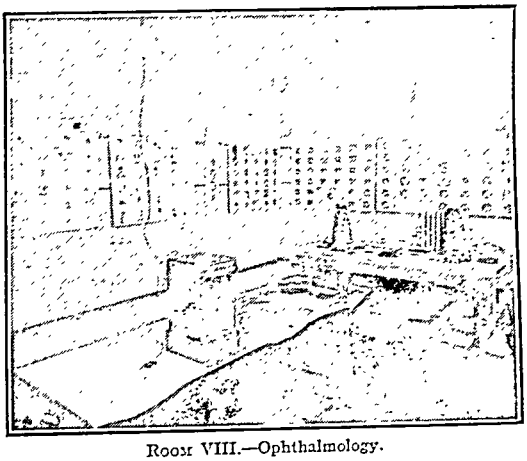
Room I.—Medicine and Surgery.

Room V.—*X*-Ray Negatives.



The total number of specimens was 1,200, which total may be regarded as respectable for a non-teaching centre. Naturally, the majority of these came from external sources, and without the collaboration of these sources the museum would have been a fiasco.

Room I.—Medicine and Surgery



This room incorporated a series of specimens of general interest from the Princess Alice Memorial Hospital, Eastbourne, and from the East Sussex County Mental Hospital, Hellingly. It is of interest to note that in recent years the mental hospitals have tended to come forward and send exhibits to the annual British Medical Association museum, and this connotes an increasing interest in scientific medicine which was formerly limited to a few mental hospitals, but is now much more general. Room I also contained a series of specimens, drawings, photomicrographs, fractional test-meal charts, and *x*-ray prints illustrating various types of carcinoma of the stomach. This exhibit was a remarkably complete exposition of the subject. There was also a composite series illustrating recent advances in the diagnosis of surgical renal diseases.

Room IV.—Pathology

The photograph illustrates a series of skiagrams of the coronary arteries in health and disease (foreground). Owing to lighting difficulties the photograph does not show the excellent series of specimens illustrating infarction of the myocardium. At the far end of the room the exhibit of recent research work on cancer may be seen, and, nearer, cultures of a new organism (Salmonella, Eastbourne). On the right is to be seen an apparatus for keeping the blood warm throughout transfusion. Photographs taken with the "supermicroscope" can be seen, and also the series of specimens of general pathological interest from various sources, both local and metropolitan.

Room IV.—Pathology and Biochemistry.

Room VIII.—Ophthalmology.

Room V.—X-Ray Photographs

One hundred and fifteen *x*-ray negatives, all shown as transparencies, were exhibited in this room, and most of them were in consecutive series. The method of mounting is interesting and effective. The room was, of course, darkened, and the general effect was striking. The series of chest radiograms collected by Professor Arthur Hall of

Sheffield are well seen in the foreground. These illustrated cases of silicosis in various trades, ranging from asbestos workers to gold miners.

In the same room, on the opposite side, there was a set of very fine ventriculograms showing normal and pathological conditions of the brain, including some interesting tumours. At the end of the room can be seen a series of renal specimens, with pyelograms illustrating the excretion and ureter catheter methods.

Room VIII.—Ophthalmology

In recent years the ophthalmological exhibit has been very small. This year we were fortunate in securing a large number (over 200) coloured drawings of abnormal conditions of the eye. The photograph entirely fails to do justice to the wonderful colouring of these valuable drawings. They represented external pathological conditions of the eye, conditions of the media and fundus, slit-lamp drawings, vascular diseases, and, in fact, almost every phase of eye disease.

There was also an interesting collection of antique ophthalmological instruments, and, for comparison, a series of modern eye instruments and, for less serious consideration, a set of stereoscopic transparencies of views of local interest.

Apart from these photographs, there were rooms in which the obstetrical and gynaecological collection was housed (Rooms II and III), the public health exhibit (Room VI), neurology and psychological medicine (Room VI), oto-rhino-laryngology (Room VI), dermatology (Room VII), hydrology and climatology (Room VII), and medical sociology (Room VI).

The commentary which was published in the *British Medical Journal* of August 8th does full justice to these sections, and it would be superfluous to detail them to any further extent. The members of the Museum Committee were particularly gratified by the appreciative tone of this article, and feel, after reading it, that their labours, extending as they did over a period of sixteen months, were well worth while.

Scotland

Royal College of Physicians of Edinburgh

Arrangements have now been further advanced for the celebration of the 250th anniversary of the foundation of the Royal College of Physicians of Edinburgh. A special service, to which representatives of public bodies will be invited, is to be held on the afternoon of Sunday, November 29th, in St. Giles's Cathedral. The service will be conducted by the Very Rev. Charles L. Warr, Dean of the Thistle, and the sermon will be preached by the Very Rev. Professor W. P. Paterson. On the following day (St. Andrew's Day), which is the actual date of the foundation, and on Tuesday, December 1st, the celebrations will be continued by a reception in the College of Art, by the conferment of a number of honorary Fellowships of the College upon distinguished physicians, and by a banquet in the Freemasons' Hall, George Street. In view of the Government's appeal for general economy, there is some doubt whether the College will, at its next meeting, approve the elaborate arrangements that have been made by the officials in regard to this banquet.

Sanitary Congress at Largs

The fifty-seventh annual congress of the Royal Sanitary Association of Scotland, attended by some three hundred delegates, was opened at Largs on September 8th. Dr. J. Parlane Kinloch, Chief Medical Officer of the Department of Health for Scotland, was appointed president. In a paper on seaside resorts in relation to public health, Mr. George Arkieson, burgh surveyor, Largs, suggested that the question of health might be more seriously considered in relation to annual holidays. His conception of a health-giving holiday was one where rest, relaxation, and recuperation were secured, without too many artificial attractions. He proposed that, as the cost of health services in the industrial towns was met from the rates, seaside resorts might receive some form of subsidy, so that holidays at these places might be cheapened. It might be said of the Clyde resorts that for eight months of the year they were small burghs, but for the remaining four months the influx of population entitled them to rank as large burghs. As there was no industry in these burghs, there was no benefit from derating. He thought that some arrangement might be made so that working-class families might be transported to the seaside from industrial centres at much reduced fares. The reorganization of hospital services from the administrative side was dealt with by Provost A. M. Macewen (Inverness), and the medical aspect was discussed by Dr. Harry J. Rae, medical officer of health, Aberdeen. Referring to the burgh and county of Inverness, Provost Macewen said that under the Local Government (Scotland) Act, 1929, the negotiations entered into between the county and town councils for the amalgamation of their hospital services had shown that, in a sparsely populated county with considerable geographical difficulties, centralization could be effectively accomplished. The correlation of hospital services through a joint committee was the only means whereby adequate and economic use could be made of the accommodation available within the area. It would often be unsuitable to limit the area to a county, and it would be necessary in many instances to link up the smaller hospitals with the central hospital by co-operation between various local authorities and the directors of all hospitals within a wider area. It was only by some such measure that the problem of maintaining adequate nursing services and special medical services for the smaller hospitals could be solved. At the same time, he thought that local authorities should interfere as little as possible with the autonomy of institutions which were working well. He also expressed the opinion that care must be taken not to get out of touch with the family doctor. Dr. Harry J. Rae said that in Scotland the hospital organization must be on a regional basis, grouped round the medical schools of Glasgow, Edinburgh, Dundee, and Aberdeen, with an additional centre for the North of Scotland at Inverness. He thought that the following facts had already emerged in regard to hospital development: (1) Municipal general hospitals were developing along lines parallel to the voluntary general hospitals. (2) Local authorities should encourage research in their municipal general hospitals. (3) With the establishment of psychiatric divisions in the general hospitals a great impetus was being given to the development of a modern mental health service. (4) The general medical practitioner must have organic association with the hospitals if an adequate health service was to be provided. (5) United training schools for nurses should be established by co-operation between the statutory and voluntary hospitals, and there should also be some association between the hospitals and the domiciliary nursing services in the community. Dr. A. S. M. Macgregor, medical officer of health for Glasgow, said that an important problem in regard to reorganization was the adequacy of the existing hospital provision. In Glasgow they had to administer a group of hospitals comprising some 6,200 beds. In a recent survey of Glasgow it had been found that about 25 per cent. of the hospital beds were devoted to the care of aged and infirm persons and those who were chronically sick, while at the same time the winter demands for treatment of acute cases led to temporary overcrowding.

cases on the borderline between health and invalidity were numerous, and the solution of the problem of classification was far from easy. He thought that many of the cases requiring permanent treatment could be accommodated in institutions other than up-to-date hospitals.

Inverness Maternity Home

The opening ceremony of the Ida Merry Maternity Home, situated in a new property at Craigmonie, Inverness, was performed on September 3rd by Lady Bertha Dawkins on behalf of Her Majesty the Queen. The home was established by the Hon. Mrs. Merry of Belladrum some years ago, and has now been transferred to more commodious quarters. It is intended for working men's wives of the Inverness district, and occupies a finely appointed building with open surroundings.

Dunoon Convalescent Homes

The annual meeting of the Glasgow and West of Scotland Convalescent Seaside Homes, Dunoon, was held on September 7th in Glasgow. Mr. William Anderson, president of the institution, who presided, stated that during the past year the homes had received 5,827 inmates. These included 1,720 men, 2,213 women, and 912 boys and 982 girls under 12 years of age. The ordinary income for the year amounted to £12,121 and the expenditure to £11,909.

England and Wales

Reduction of Local Expenditure

In view of the national emergency, the Ministry of Health has addressed a circular (No. 1222) to local authorities advising them of the manner in which reductions in general local expenditure should be determined. Special branches of expenditure will be dealt with in other communications. The circular deprecates any hasty or wholesale policy of economy, irrespective of the character or purpose of the service under consideration. It suggests that each local authority, through its finance or other appropriate committee, should subject immediately to careful and detailed scrutiny the whole field of its expenditure, with the object of deciding, for example, whether full value is being obtained for money spent, what savings can be effected in all branches of administration, and whether the contemplated development of any particular service can be safely deferred until more stable conditions prevail. In making this survey, committees are recommended to take into account the nature and probable return of the service under review, and to pay regard to its importance as a source of employment to local workers, so as to avoid the throwing of charges on national or local funds. It is also suggested that careful consideration should be given to the propriety of rationing spending committees. In regard to the remuneration of their employees, local authorities are reminded that reductions are being made " in the emoluments of classes of local officers of services which are the subject of percentage grants from the Exchequer, and in the remuneration of doctors and chemists under the national health insurance scheme." While the Government considers that the conditions of the local government service and the range of salaries vary so materially that it does not seem practicable to impose any hard-and-fast rule on local authorities in this matter, it is confident that officers of the local government service not affected by the reductions referred to will be prepared to make their contribution in the present emergency. Authorities are advised to discuss the situation with their officers in order to ensure that all may have an opportunity of sharing equitably in the sacrifices demanded by the national need. Copies of the circular can be obtained from H.M. Stationery Office (1d. net).

A Post-Graduate Tuberculosis Course in Lancashire

As in previous years, a post-graduate course in tuberculosis is being arranged in Manchester and its neighbourhood, from October 19th to 24th, under the auspices of the Joint Tuberculosis Council. On the first afternoon Dr. G. Lissant Cox will open a discussion on central administration in the county, and Dr. D. P. Sutherland will deal similarly with the city. At the Eccles Tuberculosis Dispensary, next morning, the value of electrotherapy in tuberculosis will be considered, and also radiology in the diagnosis of the pulmonary form. The meeting will then adjourn to Baguley Sanatorium, Altrincham, where, after lunch, the pathology of tuberculous lesions will be reviewed, and certain problems in the hospital treatment of advanced and chronic pulmonary cases will be debated. On the following morning, at a tuberculosis dispensary in Manchester, pneumonoconiosis in stonemasons, miners, and cotton operatives will be dealt with. After lunch, at Peel Hall Pulmonary Hospital, near Bolton, the diagnosis and treatment at a county pulmonary hospital will be surveyed, with special reference to lipiodol, artificial pneumothorax, sanocrysin, and blood sedimentation. In Manchester, on Thursday, the subjects for discussion will be artificial pneumothorax and allied therapy, and malignant disease of the chest. At the Eccles Tuberculosis Dispensary, in the afternoon, a lecture will be given on chronic inflammatory conditions of the lungs, particularly in children ; this will be followed by a discussion on skiagrams brought by members of the course. After a visit, on Friday, to the East Lancashire Sanatorium and Village Settlement, Barrowmore Hall, there will be a round-table conference, on Saturday, covering the work of care committees, home visiting, and the examination of contacts. Further information may be obtained from Dr. W. Brand, 8, Highway Court, Beaconsfield, Bucks.

The London Light and Electrical Clinic

The London Light and Electrical Clinic, which was founded by the late Mr. Campbell-Johnston, is now under the control of the Order of St John of Jerusalem, with the Earl of Scarbrough as chairman of the lay board, and an honorary medical advisory board consisting of Sir William Willcox, Sir J. Purves-Stewart, Sir John W. Thomson-Walker, Dr. F. Howard Humphris, Dr. L. Knuthsen, and Mr. Frank Romer. Sir Leonard Hill has undertaken the general supervision of the clinic. In addition to the medical officers who control treatment in special departments, a staff of honorary consultant physicians has been appointed. A large number of fully qualified and trained hospital nurses and masseuses are employed under a matron. The clinic is open from 9 a.m. to 8 p.m., except on Saturdays, when it closes at noon ; at the evening sessions workers can receive treatment. A lady almoner determines the fee (if any) in accordance with the circumstances of each patient, the clinic being run on the same lines as the out-patient department of a hospital. As at the British Red Cross Clinic for Rheumatism, so at this clinic of the Order of St. John there is a department for private patients who wish, on the recommendation of their doctor, to consult the physicians and receive the treatment which the clinic affords. A bacteriological laboratory has been established, and there are facilities for x-ray examination. There is also a physical laboratory provided with instruments of precision ; a physicist co-operates in teaching and research. There are departments for treatment by diathermy, particularly of the pelvic organs ; for electrical treatment, massage, and remedial exercises ; and for treatment by light and the infra-red rays. A playroom has been fitted with arc lights for giving artificial sun baths to children, and an inhalatorium is available for

the treatment of asthma, hay fever, and bronchitis. There are also foam baths for hydrotherapy, and a room for the Plombières treatment. While some 2,500 to 3,000 treatments are now given each week, the equipment suffices to allow this number to be doubled or even trebled. Instruction is given to nurses and to post-graduates. The aim of the Order of St. John is to make the clinic a centre of university rank for treatment, research, and teaching in methods of physical medicine.

Health of Pontypridd

Dr. A. G. M. Severn, the medical officer of health, in his annual report to the urban district council of Pontypridd, points out that, despite continued industrial depression in an area where unemployment is rife, the death rate for 1930 is the lowest on record, while the infantile mortality rate has not been increased as compared with 1929. The report indicates that every step has been taken to make the public health administration as efficient as possible. During the past year many improvements have been carried out, probably the chief of which is the completion of the new central clinic, a building in which facilities are provided for orthopaedic treatment and remedial exercises, ultra-violet light and ionization, and for dental, ophthalmic, and school clinics. Under the same roof are ante-natal, maternity, and child welfare departments, and also the offices of the health visitors, school nurses, and sanitary inspectors. It can surely be claimed that this scheme of centralization of public health activity is one of the best of its kind. Under the supervision of a female medical officer and a nurse, a local birth control clinic has been in operation for about a year. It is especially for patients referred by the maternity and child welfare clinics as persons requiring instruction in contraception on medical grounds. With regard to housing, Dr. Severn states that there is still need of small dwellings at a rent within the means of the artisan class; several groups of houses have been condemned to demolition during the next five years. Infectious diseases proved rather troublesome during the latter half of the year. Mild cases of scarlet fever and of diphtheria kept the isolation hospital full; only one case of small-pox was reported. Maternal mortality, as in other places, is still a serious problem; in Pontypridd, however, the incidence is steadily decreasing. In the part of the report dealing with schools, the medical officer states that much advantage has been gained by the purchase of Taff Vale Park as a playing field for children. A new school, accommodating 280 pupils, was opened in 1930 at Hawthorn, Rhydfelen. The feeding of school children has also been successfully carried out; milk and biscuits are usually issued free twice daily to all who are definitely suffering from malnutrition. The milk used is Grade A (tuberculin-tested).

Royal Mineral Water Hospital, Bath

Last year there were admitted to the Royal Mineral Water Hospital at Bath 1,353 patients, being 100 more than in 1929, and 163 more than in 1928. The increase in 1930 is attributed to the cessation of building operations and to the increased number of beds which have been made available. More than 500 patients admitted in 1930 were suffering from rheumatoid arthritis, and the medical report draws attention to the large number of sufferers from this condition who seek treatment too late for much benefit to result. In the early stages of this disease, if the joints are protected alike from undue strain and from too little movement, reasonable hope can be entertained that there will be not much interference with function when the acute process subsides. Delay in obtaining treatment almost always leads to irremediable limitation of function. Dr. R. G. Gordon resigned the post of physician during the year under review, and reference is made to his appreciation of the way in which the hospital committee has met the requests of the medical staff for further opportunities in investigating rheumatic diseases. It is noted in the report that co-operation with orthopaedic hospitals has helped to eliminate bedridden and chronic cases, thus enabling the Royal Mineral Water Hospital to be more fully used by patients likely to receive permanent advantage; this change has been brought about with the full approval of the medical board. Although it was not found possible during 1930 to issue any effective appeal for financial support, successful economies kept the deficit on the year's accounts down to £216.

Correspondence

DRAINAGE IN PURULENT PERITONITIS

SIR,—In the *Epitome of Current Medical Literature*, published with your issue of June 27th (p. 121), there is an abstract of an article by F. Manchini on "Abolition of drainage in purulent peritonitis." The publication of such an epitome indicates that there is something fresh and interesting to your readers in its subject-matter.

The slowness with which this treatment is being adopted by surgeons is impressive. After experience of it for nearly twenty-five years, I consider that it should be routine treatment. Nine years ago, during a visit of the Chirurgical Club of Great Britain to Aberdeen, I demonstrated half a score of such cases lying in my wards, recently operated on and convalescing smoothly. I enclose a reprint of a paper, published in August, 1924, in *Surgery, Gynecology and Obstetrics*, entitled "Some problems of drainage," which deals fully with this matter as well as with considerations concerning drainage of other parts.

We are apt to forget that the formation of pus is a "laudable thing," without which the vast majority of living people would have been dead long ago. Why, then, should we dread "pus forming"? It is a sign of salvation, but there is every reason to try to prevent its formation. Remove the cause which necessitated its formation, and which we should dread. Do not hinder natural defensive and curative processes by introducing foreign bodies. Experience has shown that there are few exceptions to the rule that drainage is unnecessary when other essential procedures have been attended to.

I believe that I was responsible for the slogan regarding drainage which arose during the war—"Down to but not into." This applied, and applies, equally and especially to the brain and to the potential cavities, whether of the chest, of the abdomen, or of the joints. A principle of treatment which can be applied to various parts under varying conditions with greater success than any previously tried must be sound. Routine use of drainage by a surgeon of sound technique denotes an ultra-conservative and rather craven frame of mind, and a preference for his own instead of for nature's methods, or, to put it otherwise, implies an unfair disregard of the patient's resisting and healing powers, which thereby are subjected to greater strain.

Avoidance of drainage in severe cases of peritonitis reduced mortality in my experience from 9 per cent. to under 5 per cent. (1924).—I am, etc.,

Montreal, Aug. 31st. HENRY M. W. GRAY.

HUNGER PAIN AND PRESERVATIVES

SIR,—As a member of the Departmental Committee on the Use of Preservatives and Colouring Matters in Food (1923-24), I am much interested in Mr. James Forrest's letter on this subject in your issue of September 12th. It would add to the value of his communication if he

could state whether he was able to connect his gastric or duodenal troubles with any particular preservative At the Departmental Committee I advanced the view that certain gastric and intestinal disturbances might be caused by boric acid as a preservative in articles of food, but a peculiar interest in Mr Forrest's communication is that he still experiences his old symptoms if taking food containing preservatives

The Departmental Committee reported in 1924, and since that date the employment of boric acid as a preservative in any article of food has been strictly forbidden The only preservatives allowed in a few specified articles of food, and in certain beverages, are sulphur dioxide introduced as sulphurous acid or as a sulphite, and benzoic acid introduced as such or as a benzoate Sulphur dioxide in small quantities is permitted in sausages, jams, dried and preserved fruits, beer, cider, certain wines, cordials, and fruit juices Benzoic acid in small quantities is permitted in coffee extract, non alcoholic wines and cordials, unsweetened fruit juices, sweetened mineral waters, and brewed ginger-beer With the exception of beer, the presence of either of these preservatives must be declared

If Mr Forrest's symptoms are still due to a preservative I am anxious to know what that preservative is —I am, etc ,

Lumpsfield, Sept 12th ARTHUR P LUFF.

INTRACRANIAL HAEMORRHAGE OF THE NEWBORN

SIR,—I was interested to read in the *Journal* of September 12th (p 512) Dr James Cook's letter in which he states that intracranial injuries to a great extent are due to uterine pressure acting on a difficult outlet I can recall a most unusual case of a baby weighing 6 lb 9 oz , which was delivered by elective Caesarean section, and which subsequently died The post mortem examination revealed definite intracranial haemorrhage The operation was performed with due care and caution before labour commenced It did not deviate technically from previous operations in which the babies had survived

Again, Dr G B Fleming, in an admirable article in the same issue of the *Journal*, records (at page 483) a case of facial paralysis in an infant delivered by Caesarean section after labour had been in progress for two hours

We have here two most illustrative cases of foetal injury in which manipulative trauma by the accoucheur was reduced to an absolute minimum It seems logical to assume that there must have been some other causative factor present in these two cases —I am, etc ,

The Hospital for Women, Soho Square, W 1, Sept 14th W C W NIXON, F R C S

THE CAUSE OF TORTICOLLIS

SIR,—The communications of Dr G B Fleming and Mr P B Roth in your issue of September 12th have an interest for me Dr Fleming, writing on injuries in the newborn, does not refer to my paper on visceral haemorrhages in stillborn children,[1] though he gives a list of thirty one authors, the first of whom, Dr J N Cruickshank,[2] makes complimentary references to it Dr Fleming thinks that torticollis is probably due to venous obstruction and ischaemic contracture I believe it is due to fibrosis at the site of a haematoma of the sterno mastoid muscle, which, occurring at birth, I have known to be followed by torticollis, requiring operation at the age of 16 years

[1] *Obstet Soc Trans* 1891, xxxiii
[2] Neo-natal Death Medical Research Council Report, 1930, No 16 and *Lancet*, 1923, i, 836

In a paper in the *Journal of Pathology and Bacteriology* (vol i, p 113), I showed that the haematoma is due to bruising, stretching, and rupture at the time of birth The paper is illustrated, and is based on the post mortem examination of fifteen newborn children, of whom three were delivered by the vertex and eleven by the breech or feet , in one the mode of delivery was doubtful If, as is probable, this case was also a breech or footling delivery, the proportion of breech or footling deliveries to vertex (12 out of 15) in these cases of haematoma is the same as that found by Mr Roth in his cases of torticollis (8 out of 10)

I do not think that ordinarily there is anything wrong with the muscle before delivery , it is the treatment which is wrong, especially the so called "Prague" method of delivering the after coming head, which is better delivered with forceps The asymmetry of the face in babies a few days old suffering from haematoma of the sterno mastoid (of which I have quoted two cases in my paper) must be very exceptional —I am, etc ,

London, W 1, Sept 12th HERBERT R SPENCER

BREECH PRESENTATION

SIR —The authors of the three articles on breech presentation published in the *Journal* of August 29th do not agree as to the foetal mortality rate Mr Gibberd says that "the gross mortality rate for uncomplicated cases is about 30 per cent for primiparae and about 20 per cent for multiparae, and after making all possible allowances foetal death rates of 28 and 15 per cent respectively can be taken as the minimum estimate of the dangers associated with the breech labour itself " According to Mr Bourne, 'the results at Queen Charlotte's Hospital show a foetal mortality of 11 per cent for primiparae and 8 per cent for multiparae Even allowing for the different methods of classification adopted, the difference between the percentages stated by the two authors is glaring and requires explanation

All authors are agreed that turning should be attempted some time during the thirty fifth week This line of procedure is of course, not free from risk to an elderly primipara, with possibly some fibroids embedded in the uterine wall, or even a multipara whose uterine muscle is flabby from successive pregnancies, complicated occasionally by sepsis The maternal mortality is not stated, but it must of necessity be very high, as the line of treatment to be adopted in cases in which turning fails is undoubtedly very dangerous for the mother, to say nothing about the foetus The vaginal canal has to be stretched, the cervix has to be crudely dilated to admit the hand freely (how tiresome it is for the fingers!) the whole length of the arm has to be introduced into the uterus, past the impacted body of the foetus to bring down first one extended leg and then the other after the legs are born up to the hips the hand has to be introduced again to bring the two arms down and finally one has to face the problem of delivering the head "If done too quickly from a primigravida, especially if the head is not well flexed, there will be too sudden moulding of the cranial bones, with the serious risk of tears of the dural septa and intracranial haemorrhage, while if too much time is allowed, the child will die of asphyxia" If the head is at all large delivery by either the Prague manœuvre or the jaw traction method with the too frequent injury to foetal face floor of mouth and mandible) is a difficult affair I have seen a mother brought to hospital with the foetus hanging down from the vagina by its neck, another with a loose foetal head inside the uterus, and still another with complete rupture of the uterine wall and prolapse of intestine into the vagina The only thing to do in these cases is to perform

craniotomy on the after-coming head, and it is a very difficult operation to perform, especially if the body of the foetus is fat and plump. There is serious risk of injuring the uterus, vagina, and the bladder by the attempted introduction of sharp perforators and craniocasts. And when at last the foetus has been removed and the placenta delivered the unfortunate mother and the not less unfortunate practitioner have to face the onset of post-partum haemorrhage—to say nothing of puerperal septicaemia, which is so frequent after these intrauterine manipulations.

What are the objections to the performance of Caesarean section in all cases in which version has failed? The maternal mortality is stated to be 1 per cent. after this operation, and the foetal mortality rate ought to be no higher. This compares more than favourably with even Mr. Bourne's figures of 11 per cent. There is no risk of breaking any foetal bones, causing Erb's paralysis or spastic paraplegia after this operation; the convalescence is more pleasant than even after a normal but severe confinement, as there is so little shock, so little loss of blood, and so little damage done to the maternal passages; and finally, it is an operation that any practitioner who is used to major surgery can perform.

Another question arises: Should midwives be allowed to take sole charge of breech cases, as is the practice at present?—I am, etc.,

M. R. SONI, B.A., M.B., Ch.B.Ed.

Withington, Manchester, Sept. 3rd.

SIR,—I have read with great interest, in your issue of August 29th, the three papers on breech presentation—foetal mortality, ante-natal treatment, and management of breech labour—all written from a hospital and statistical point of view. I should like to make a few remarks from a private practitioner's point of view after forty-five years' practice.

As to foetal injuries and death in breech births, I consider that both are produced by want of judgement—either too much force or too much haste—and the deaths by too much delay. Keep cool, and keep moving after the breech is through the cervix, and all ought to be well. In hospital cases it seems to me that time is no object. We do not hear how many hours the woman is left in labour. This, in private practice, is a large factor: the woman stands first and the child second. A happy medium has to be struck within reason, and I have not found this consideration cause any more risk to either. Up to a few years ago delivery by complete version was my favourite method of coping with persistent occipito-posterior positions, and I consider extended legs are much more in need of adjustment than extended arms. It surprises me to read that so many foetal deaths are caused by cranial injuries, but Mr. Gibberd confirms his statements by post-mortem examination, which is not available in private practice.

Turning to the management of breech labour, I very much admire Mr. Bourne's view, only I should be more emphatic. The left leg should always be brought down as Rule No. 1. After that there is no hurry. When the breech is through the cervix I consider the latter is fully dilated, and, if the head is larger, the cervix cannot be more than fully dilated from an obstetrical point of view. When the breech is born is the essential time to keep moving, but slowly. If the arms are folded, slow traction is essential. If the arms are extended the body should be carried hard against the woman's rectum, with the child's back pointing towards the woman's pubes and the right hand passed up the side of the foetus; the shoulder will be found presenting; passing the finger over this, and sweeping down it, will carry the arm down into the vagina. The whole foetus should now be rotated, and the child's body, as before, brought against the woman's rectum. The child's back will be facing the woman's spine. This will bring the remaining shoulder into view, and the arm can be released as before. The child's body is once more rotated and carried forward between the woman's thighs. This will bring the foetal chin into view. Gentle traction applied to the child's shoulders and a finger passed up into the mouth help to depress the chin. If delay occurs axis-traction forceps should be applied.

When the head is presenting, and can be held by a finger pressed in the ischio-rectal fossa, the forceps should be removed and the rest attained by manipulation, the patient being still under complete anaesthesia. In all presentations, as the head is coming through the outlet, much easement of the perineum can be attained by intermittently pressing on the soft structures in front of the head.

Ante-natally one point is not mentioned, and that is the bi-parietal measurement of both parents' heads. How many times have I seen the cause of a difficult forceps case on coming downstairs and seeing the anxious father's head for the first time. I think the size of the parents' head should be a very deciding factor as to the advisability of Caesarean section in such cases.—I am, etc.,

Wallington, Surrey, Sept. 8th. A. Z. C. CRESSY.

DR. BRIGGS OF LIVERPOOL

SIR,—I wish to correct an error which appeared in a paper written by me, and published in your columns, in which I referred to "the *late* Dr. Briggs of Liverpool." It was due to a momentary mental aberration at the time of writing, for I realize, quite well, that happily Dr. Briggs is fit and well. I hope he will accept my apologies for this absurd mistake, which would have been tendered before had I not been out of touch with my correspondence.—I am, etc.,

London, W.1, Sept. 14th. ALECK W. BOURNE.

THE BLOOD PRESSURE IN THE PSYCHONEUROSES

SIR,—In his admirable address on the significance of a raised blood pressure Professor John Hay (*Journal*, July 11th, p. 43) has emphasized the importance of accurate estimation of both systolic and diastolic blood pressures. The necessity for this insistence is shown by a remark made a few years ago by a distinguished physician and teacher of medicine: "I don't know if you have ever learned anything from the estimation of the diastolic pressure, but it conveys *nothing to me*." V. Pachon and R. Fabre[1] recently directed attention to the common error of assuming the presence or absence of hypertension from the estimation of the systolic pressure alone; they insist, indeed, that a normal or slightly raised systolic pressure, when associated with a diastolic pressure of over 100 mm. Hg, may indicate a serious degree of cardiac dilatation.

Professor Hay's reference to the effect of psychological states on the blood pressure is of great importance. Most writers on neurology and psychiatry refer but briefly to the hypertension of melancholia, and do not emphasize its association (in many cases) with serious digestive derangement—a thickly coated tongue, constipation, oliguria with excess of urea, uric acid, indican, and phosphates, all of which indicate defective metabolism and elimination of waste products. On the other hand, neurasthenia, psychasthenia, "anxiety states," and hyp-

[1] *Journ. de Méd. de Bordeaux et du Sud-Ouest*, May 30th, 1931, p. 493.

chondriasis are usually accompanied by hypotension. The following cases illustrate this.

1. A man, aged 69, suffering from severe melancholia, with insomnia and great agitation, had a pulse rate of 72, while his blood pressure was *164/78 mm. Hg.* The tongue was thickly coated, and the urine highly concentrated, with a heavy precipitate of phosphates and calcium oxalate; its specific gravity was 1020, and there was present a minute trace of albumin, but no sugar. In three days the blood pressure fell to 130/70 mm., with a definite improvement in his mental and physical condition.

2. A man, aged 69, with an "anxiety state," insomnia, and extreme agitation, had a blood pressure of 112/70 mm. only.

3. A male psychasthenic, aged 40, had a blood pressure of 105/52 mm. He complained of vertigo, loss of power of concentration and of memory, coldness of the extremities, and a constant sense of abdominal distension. The heart and urine were normal, and there was no ascites. On the assumption that he suffered from cerebral anaemia, his medical attendant had prescribed tablets of suprarenal substance for several weeks. When ephedrine hydrochloride (in 1/2-grain doses night and morning) was substituted, his blood pressure rose to 126/70 mm., with definite relief of his circulatory and psychological symptoms.

The characteristic hypertension of melancholia, as compared with the hypotension of neurasthenia, psychasthenia, and hypochondriasis, is of great importance in differential diagnosis and prognosis.—I am, etc.,

C. W. J. BRASHER, M.D.

Great Missenden, Bucks, Aug. 25th.

SHORTENING AN ELONGATED UVULA FOR THE CURE OF COUGH

SIR,—Mr. Bedford Russell, in his interesting and instructive paper on "Sore throats of other than tonsillar origin," condemns (*British Medical Journal*, September 12th, p. 487) the "erstwhile fashionable operation of cutting off a piece of a lengthened uvula with a view to curing a cough," and states that "it was utterly unsuccessful in achieving its purpose." I beg most humbly to demur from this opinion and to assert that in many appropriate cases I have found it absolutely successful. I hope in the near future to offer a description of what I consider suitable cases with reports of a consecutive series in support of my contention.—I am, etc.,

London, Sept. 15th. JAMES DUNDAS-GRANT.

THE SINO-AURICULAR NODE

SIR,—In my obituary notice of the late Group Captain Martin Flack, which was written hurriedly, I did not express fully enough the debt which Flack owed to Sir Arthur Keith, who had been looking for the sino-auricular node in human hearts sent to him by Sir James Mackenzie, and who put Flack on to examine the mole's heart, where evidence of the node was clearly found. The anatomical discovery was then verified experimentally on the living animal by Flack.—I am, etc.,

Chalfont St. Peter, Bucks, Sept. 11th. LEONARD HILL.

MORTUARY INSCRIPTIONS

SIR,—To one whose Latinity has kept enough of third-form quality, the inspection of ancient mortuary inscriptions in church and cathedral lends an added interest as, with pocket dictionary in hand, he scans the stony memorials of post-mortem virtue or recognizes that common causes of premature mortality were as much in evidence then as now. One such cause, however, has ceased to be noted on funerary marble, for variola has come under control, and Jenner's work has put an end to much stone-mason's labour. As most of the Latin is *in oratio directa*, the interpretation is not difficult, and its quality is what Dr. Parr called "good English Latin" when listening to a lecture at the College of Physicians. So, Sir, an it please you, I will put down a few instances gathered in holiday rambles.

In Canterbury Cathedral, the south transept, on a large flat black marble or slate ledger stone, is an inscription to the son of the Rev. Thomas Ralph Blomer, S.T.P., who died in 1719, at the age of 10, from "Morbo Ambiguo et inclementi"; and it goes on to add: "Et Heu! Necquicquam invocatâ Medicinâ." Do you know of a neater or more concentrated translation of "Physicians were in vain"? So, in Bath Abbey, Eliza Peirce "ended a sickly life by sudden death caused by an inward imposthume" in 1671—possibly the bursting of a pulmonary abscess or some other form of tuberculous accumulation. In the same way, in the chancel of Thurnham Church, Kent, there is a really beautiful marble tablet, and on it is an inscription to Mary Dering, *daughter of the vicar, who died in 1725*, aged 43:

"M.S. Mariae Dering faeminae tam Naturae quam Gratiae dotibus ornatissimae vix intra duos annos post abscissam cancri causâ sinistrâ mammam (animo nec chirurgi cruciatu *nec morbi languore, nec mortis accessu, fracto,*) Phthisi, placidissima periit."

Now, did she perish from a tuberculous breast with secondary pulmonary infection, or was it a case of cancer with lung deposits?

In Rochester Cathedral is a little bit of praise for a physician: "Memoriae Sacrum Augustini Caesaris M.D. qui A.D. 1688 Augusti die 7mo mortalitate valedixit"; and later on it proceeds:

"Morborum enim turmas aliis inexpugnabiles, Veniens, Videns, Vicit, Victor Medicus. Nunc Durobrovis Luge! Luge Cantium! Nunc exultate febres et dira malorum cohors Agite triumphos qui vos cohibere potuit Captivus duxit. Ex humanis cum *Ευθανασια* demigravit. Jam adscriptus Divorum numero ipse Caesar. Anno aetatis LXXV.

and so on for many more lines. Apparently a very successful practitioner, but it should be noted that the monument was erected by his wife.

It is interesting to remember how successful treatment of fevers was the great aim of physicians in those times, and the Latin poems in praise of "*fever doctors*" are full of their praises, and give almost divine attributes to them, as is seen in the lines on Dr. Alexander Russell, F.R.S.:

> "Innocuas placide corpus jubet urere Flammas
> Et justo rapidos temperat *igne Focos*
> Extorsit Lachesi cultros pestique venenum
> Abstulit et tantos non sinit esse metus."

Of small-pox mortality there are innumerable inscriptions, and especially was it fatal to the lying-in woman. Again, childbed fever is noted, as in Thaxted Church, Essex. "Anna uxor Roberti Barnard, A.M. Adhuc virenti Juventa. Dira mox a Partu febri correpta obiit 1684 anno aetatis suae 30." Her son-in-law, Thomas Swallow, M.B.Cantab., fell a victim to his work: "Ineluctabili variolarum impetu oppressus occubuit 1701 aet. 26." Catherine Upcott is noted in Rochester Cathedral as dying in 1727, "Correpta febre populari." Whether this should be translated "epidemic" or "common" I know not.

Here and there a little touch of description (rem acu tetigisti) shows that personal interest in the case which it is no longer the custom to advertise on tombstones. Frances Barrell, aged 17: "Morbo tandem minutatim confectus" (1745). The Rev. Samuel *Warren, vicar of* Ashford, Kent, 1720, aged 84: "Senectâ potius quam morbo confectus." This sounds better than the "*senile* decay" of a modern death certificate. His wife, Sara, 1687, aged 40: "Quae statim post decimum partum variolis oppressa in Xto obdormivit."

I have a good many more of these memorials of "end-results," but I think, Sir, that this small selection will do for the present. To a man retired from, but still interested in, his profession, this side-line of remembrance affords a pleasant if *grave* occupation when on holiday bent.—I am, etc.,

F. WILLIAM COCK, M.D., F.S.A.

Appledore, Kent, Sept. 1st.

PROSTATECTOMY OR DRAINAGE

SIR,—It would be helpful if Sir James Barr (June 27th, p. 1138) would advise as to how progressive enlargement of the prostate gland can be avoided by suitable treatment. Unfortunately, most of us are confronted with *un fait accompli*. We are then faced with the grave responsibilty, especially in the case of the aged, of deciding whether prostatectomy or catheter life should be recommended—the former entailing real immediate risk to life, the latter deferred risk attended by much additional discomfort or even misery. It would be interesting to know the experience of surgeons who have in such cases resorted to suprapubic drainage. Is it possible with a suprapubic catheter in permanent use, with or without a waterproof receptacle, to obviate leakage?—I am, etc.,

Bromley, Sept. 3rd. ERNEST F. NEVE, M.D., F.R.C.S.Ed.

Obituary

By the death of Mr. HERBERT JOHN ROBSON, Leeds loses one of its oldest practitioners, and his passing will leave a gap in professional and in family circles. Mr. Robson was a student of the Leeds School of Medicine before its union with the Yorkshire College, and took his first qualification, that of Licentiate of the Royal College of Physicians of Edinburgh, in 1883. He at once entered on general practice, and soon became partner with his distinguished brother, Sir Arthur Mayo Robson, whose partnership with the late Mr. William Hall had about that time come to an end. When Sir Arthur, then Mr. Mayo Robson, gave up his general practice and devoted himself with such conspicuous success to surgery, adding thereby to the lustre of the Leeds School, Mr. Robson was for a good many years associated with Dr. McGregor Young. Some two years after he obtained his first qualification Mr. Robson became a Member of the Royal College of Surgeons of England. In 1904 he joined the Volunteer Medical Staff Corps, of which Professor de Burgh Birch, ably assisted by Mr. Matthew J. Oliver, the demonstrator of anatomy, was the originator and for many years the life and soul. He soon got his commission as lieutenant, and held the rank of captain in the R.A.M.C. at the outbreak of the great war. He served throughout the war in various capacities, being medical officer in No. 2 and No. 30 General Hospitals in France and senior medical officer to No. 1 Camp at Calais, as well as doing duty in different field hospitals. As a family practitioner Mr. Robson's reputation was deservedly a high one. The writer of these lines can call to mind many occasions on which he met him in consultation, and he was always struck by the meticulous care with which he marshalled the points in the case under discussion, by his kindness of heart, and by his conscientious desire to do the best for his patient.

Dr. ALBERT EDWARD BRINDLEY, who died recently at Nottingham at the age of 68, had been medical officer of health for Derby for twenty-two years. He received his medical education at Owens College, Manchester, where he graduated M.B., Ch.B. in 1889. Three years later he graduated M.B.London, proceeding M.D. in 1894. In 1898 he obtained the D.P.H. Among the numerous posts he had held were those of examiner and joint lecturer in public health in the University of Manchester, Fellow of the Society of Medical Officers of Health, and member of the Manchester Pathological Society. His work in Derby was on pioneer lines. When he assumed office there the death rate was 11.1 per cent. With only one assistant in a town of 100,000 inhabitants he set to work energetically, and such activities as the treatment of tuberculosis were actually being organized in Derby long before regulations in this respect were drafted elsewhere. His previous experience as medical officer of health for the county borough of Bury, and as medical superintendent of the Nightingale Hospital and the Ainsworth Small-pox Hospital, had given him progressive and practical ideas which he was able to put into effect at Derby. He retired less than a year ago under the age-limit scheme, and soon afterwards his health, which had been impaired for some time, broke down. He was a member of the British Medical Association and of the local Rotary Club, and was very popular in Derby and its vicinity.

Dr. WILLIAM CHARLES FREDERICK HARLAND, who died on August 29th, was born in 1876, and received his medical education at St. Bartholomew's Hospital. He obtained the diplomas of M.R.C.S., L.R.C.P. in 1903, and graduated M.B., B.S.Lond. three years later. After holding resident posts at the Metropolitan Hospital and the Evelina Hospital for Children he was appointed house-physician to the Royal Infirmary, Hull. He was elected assistant physician to that institution in 1919; and had been physician to the Victoria Hospital for Children, Hull, for the last twenty years. Dr. Harland held a commission during the war in the R.A.M.C., and was subsequently medical referee to the Ministry of Health and the Ministry of Pensions. His great popularity in the city generally was manifested at his funeral; Hull city policemen acted as bearers. He was a member of the British Medical Association.

The following well-known medical men have recently died: Dr. MAURICE DE FLEURY, a Paris psychiatrist, member of the Académie de Médecine and Commander of the Legion of Honour, aged 71; Dr. VEDEL, professor of clinical medicine at the Montpellier Faculty of Medicine and Officer of the Legion of Honour; Dr. EUGÈNE DERRIEN, professor of biological chemistry at Montpellier, corresponding member of the Académie de Médecine, aged 52; Dr. BRODISLAS SEWICKI, honorary professor of the Warsaw Faculty of Medicine; Professor HEINRICH FRENKEL-HEIDEN, a Berlin neurologist and author of a work on treatment of tabetic ataxia by exercises, aged 72; Dr. ERICH EBSTEIN of Leipzig, a writer on the history of medicine, aged 51; Dr. PAUL SCHIEFFERDECKER, honorary professor of anatomy and anthropology at Bonn University, aged 83; Dr. EDMOND CHAUMIER of Tours, director of the vaccine institute at Plessy-les-Tours, corresponding member of the Académie de Médecine, and an eminent archaeologist; Dr. EDWARD CAMPBELL DAVIS, emeritus professor of obstetrics and gynaecology at Emory University School of Medicine, Atlanta, Georgia, aged 63; and Dr. RALPH WALDO LOBENSTINE, a New York gynaecologist, aged 56.

Universities and Colleges

UNIVERSITY OF LONDON

UNIVERSITY COLLEGE HOSPITAL MEDICAL SCHOOL

The following lectures in pathology will be given on Tuesdays, at 5.15 p.m., in No. 1 Lecture Theatre of the Medical School, University Street, Gower Street, W.C.1:—October 13th and 20th: Professor J. C. G. Ledingham, F.R.S., Resistance to infection, natural and induced; October 27th and November 3rd: Professor C. R. Harington, F.R.S., The chemistry and functions of the thyroid gland; November 10th and 17th: Dr. Harriette Chick, Vitamins and disease; November 24th, December 1st and 8th: Dr. R. T. Grant, The pathology of endocarditis. Admission free to medical students and graduates.

ST. GEORGE'S HOSPITAL MEDICAL SCHOOL

As a result of the annual examination, the following have been awarded entrance scholarships and exhibitions: J. A. Lewis, the William Brown Senior Exhibition of £120; Morwa Williams, the William Brown Junior Exhibition of £80; F. R. Berridge, an Anne Selina Fernee Scholarship of £80; R. D. Holloway, an Anne Selina Fernee Scholarship of £80; A. N. F. Critchley, an Anne Selina Fernee Exhibition of £60; R. A. Binning, an Anne Selina Fernee Exhibition of £60; C. E. Elliott, the Devitt-Pendlebury Scholarship of £50; and S. Ginsburg, an Entrance Exhibition of £40.

Medical Notes in Parliament

[FROM OUR PARLIAMENTARY CORRESPONDENT]

The House of Commons this week read the National Economy Bill a second time, and continued the debate on the Budget resolutions. During the discussions Mr. Snowden said that he expected an early General Election.

In consequence of the decision of the Government to take the whole of the time this session, a number of private members' Bills have been dropped. These include the Hospitals (Relief from Rating) Bill, introduced by Mr. F. L. Jones; the Advertisements Regulation (Amendment) Bill, presented by Dr. Vernon Davies; Industrial and Provident Societies (Amendment) Bill, introduced by Dr. Morgan; the Leasehold Enfranchisement Bill, introduced by Mr. Hopkin; the Nursing Profession (Wages and Hours) Bill, presented by Mr. Brockway; the Proprietary Medicines Bill, presented by Mr. Somerville Hastings; and the Vaccination Bill, introduced by Mr. Groves.

The Therapeutic Substances Regulations, 1931, dated July 25th, were laid on the table of the House of Commons on September 14th.

National Economy Bill

The second reading of the National Economy Bill was moved in the House of Commons on September 11th by the Prime Minister (Mr. RAMSAY MACDONALD). He said that the savings to be made in national health insurance, set out in a White Paper already presented to the House of Commons, would be transferred fom one fund to another, with the object of maintaining the health service in its present efficiency.

Mr. CLYNES moved the rejection of the Bill, and the debate was adjourned till September 14th.

The debate was continued on September 14th, and the second reading was carried by 310 to 253. Mr. GREENWOOD asked whether there would, under the Bill, be a restriction of the school medical service. How far were the restrictions to go in regard to the Ministry of Health?

Sir HERBERT SAMUEL (Home Secretary) read out figures of departmental economies, which the party leaders were informed the late Cabinet had approved. These included £700,000 in respect of the Ministry of Health, for doctors, and £1,000,000 for other economies in that department.

Mr. GREENWOOD said that there must be some misapprehension. Could the Chancellor of the Exchequer tell him of any occasion when he ever accepted that figure?

Mr. SNOWDEN said that there were certain definite economies under the Ministry of Health vote which were accepted by Mr. Greenwood. There was an additional sum, but it was to be left to the Department to arrange how that additional sum should be arrived at. It was quite true that Mr. Greenwood never committed himself, beyond £750,000, to any definite item of economy, but he did take the instruction from the Cabinet to try to find other economies.

The Emergency Budget

On September 10th Mr. SNOWDEN introduced a special Budget. He said it included sacrifices and burdens which were necessary to avert far greater evils. The national income was falling rapidly, and to restore solvency in the national finances the country must face up to the provision. The estimated deficit on this year's Budget, on the basis of existing taxation, was £74,700,000. Next year the deficit would be £170,000,000. Economies over the whole field of Government expenditure would be made to save £22,000,000 this year and £74,000,000 in a full year. He proposed to increase the standard rate of income tax for the current year by 6d., making it 5s. in the £. Personal and other allowances would be amended to bring within the range of the tax a large number of persons with incomes rising to £500 a year who at present paid no income tax. He proposed to put 10 per cent. on the surtax. He further proposed increases in the beer and tobacco duties, and a further 2d. a gallon on petrol, making a total duty of 8d.

The House agreed to resolutions imposing taxes at the new rates

Statistics of Insurance Medical Practice

Mr. RHYS DAVIES asked the Minister of Health to show in tabular form, annually in each case, the number of medical practitioners acting as panel doctors under the national health insurance scheme since it came into operation; the total amount paid to such panel doctors; the number of doctors receiving payment in this connexion; the number of insured persons; and the capita grant per insured person paid.

Mr. Chamberlain circulated the following reply on September 14th:

Year	No. of Insurance Doctors	Total Payments to Insurance Doctors	No. of Insured Persons	Capitation Fee
		£		
1913	12,674	3,858,000	11,521,772	1913-19 7s 6d. (on average)
1914	12,858	3,673,000	12,425,421	
1915	12,675	3,470,000	10,116,920	
1916	12,321	3,353,000	10,333,003	
1917	11,931	3,845,000	10,622,562	
1918	11,675	3,641,000	10,679,501	
1919	11,346	4,052,000	11,454,616	
1920	11,620	7,403,000	12,931,763	1920-1 11s.
1921	12,216	7,824,000	13,225,030	
1922	12,531	6,773,000	13,275,000	1922-23 9s 6d
1923	12,852	6,670,000	13,295,000	
1924	13,211	6,476,000	13,672,000	1924-30 9s.
1925	13,823	6,518,000	13,695,000	
1926	14,432	6,651,000	14,102,000	
1927	14,952	6,831,000	14,363,000	
1928	15,269	7 037,000	14 814,000	
1929	15,563	7,109 000	14 959,000	
1930	15,750	7,300,000	15,393,000	

Town and Country Planning.—Mr. RAMSAY MACDONALD told the House of Commons, on September 10th, that he could not then make a definite statement about further stages of the Town and Country Planning Bill. The Government was trying to rescue non-controversial measures.

Proprietary Remedies.—On September 14th Mr. MILLS asked the Chancellor of the Exchequer if he was aware that thermogene, antiphlogistine, and many other patent medicines were now sent to qualified chemists without revenue stamps of 3d. and 6d. attached, and whether he would consider taking steps to protect the revenue. Mr. SNOWDEN replied that the law provided for exemption from medicine stamp duty in favour of "known, admitted, and approved" remedies when sold under certain conditions by duly qualified chemists or druggists. He was aware that certain manufacturers had taken steps to bring their preparations within the scope of that exemption, but this was not a matter in which he could interfere.

Limitation of Narcotic Drugs.—Captain EDEN, replying to Dr. Fremantle on September 14th, said he was informed that legislation amending the Dangerous Drugs Acts in certain respects would be necessary before the Convention for the Limitation of the Manufacture of Narcotic Drugs could be ratified. The matter was under consideration.

Housing.—Mr. CHAMBERLAIN, Minister of Health, states that between June 1st, 1929, and July 31st, 1931, 32 houses were completed with State aid under the Addison Housing Act, 1919, 44,289 under the Chamberlain Act 1923, and 124,514 under the Wheatley Act, 1924. Between the same dates there were completed, without State assistance, 220,419 houses of a rateable value not exceeding £78 (in Metropolitan Police district, £105).

Movement of Ambulances in Ireland.—Mr. Malcolm MacDonald states that no restrictions are imposed upon ambulances entering the Irish Free State from Northern Ireland when the need arises.

The Services

DEATHS IN THE SERVICES

Surgeon Captain Robert Francis MacMahon, R.N. (ret.), died at Sherborne on June 27th. He was educated in Dublin, in the school of the Irish College of Surgeons, and after taking the L.R.C.P. and S.I. in 1901, served as a civil surgeon in the South African war. He entered the Navy as surgeon in November, 1902, became staff surgeon in 1910, and fleet surgeon in March, 1918, retiring, with a step of honorary rank, on July 30th, 1928. He served afloat throughout the late war. In March, 1914, he was appointed to a battleship, H.M.S. *Hindustan*; in August, 1915, to H.M.S. *Vindex*, a seaplane carrier attached to the Harwich force; and in March, 1918, to H.M.S. *St. George*, a destroyer depot ship. Since the war he had served in the cruisers *Antrim*, *Yarmouth*, and *Castor*, and in the battleships *Revenge* and *Malaya*, and from October, 1926, till his retirement, was in charge of the Royal Marine Infirmary at Chatham.

Lieut.-Colonel Rustomjee Hormusjee Cama, Madras Medical Service (ret.), died in India on June 25th, aged 74. He was born on April 15th, 1857, and was educated at the Grant Medical College, Bombay, where he took the diploma of L.M.S. in 1879, and later in the same year took the M.R.C.S. and the L.R.C.P.Ed. Entering the I.M.S. as surgeon on March 31st, 1880, he became lieutenant-colonel after twenty years' service, and retired on July 13th, 1910. He served in the Burma campaign in 1885, when he took part in the occupation of Mandalai and Bhamo, and received the frontier medal with a clasp; and in the Chin-Lushai campaign on the North-East Frontier of India in 1889-90, receiving a clasp.

Medical News

Lord Ponsonby will present the prizes and deliver the inaugural address, at 3 p.m. on Thursday, October 1st, in the board room of St. George's Hospital. The annual dinner of St. George's Hospital Medical School will take place at the Hyde Park Hotel, Knightsbridge, at 7.15 for 7.45 p.m. on the same day.

The ninety-seventh winter session of the Middlesex Hospital Medical School will open on Thursday, October 1st. Professor James McIntosh, M.D., director of the Bland-Sutton Institute of Pathology, will deliver the introductory address in the Queen's Hall, Langham Place, at 3 p.m., and Sir John Bland-Sutton, Bt., consulting surgeon to the hospital, will distribute the prizes. The wards of the new west wing, the new nurses' home, and the medical school and research departments, will be open for inspection. The annual dinner will be held at the Savoy Hotel on the same evening at 7.30 o'clock.

The Society for the Study of Inebriety announces that the fourteenth Norman Kerr Memorial Lecture will be delivered by Viscount Brentford on Tuesday, October 13th, at 4 p.m., in the Friends House, Euston Road, N.W. His subject is "How the alcohol question concerns the duties of the Home Office."

The Harben Lectures will be delivered at the Royal Institute of Public Health (37, Russell Square, W.C.) by Dame Louise McIlroy, on "Recent researches in the prevention of maternal, foetal, and neo-natal mortality." The first, on October 5th, will deal with the ante-natal period, the second, on October 6th, with the intra-natal period; and the third, on October 7th, with the post-natal period. The lecturer will describe the methods employed, and the results of the research work carried out, in the Obstetrical Unit of the Royal Free Hospital, during the last ten years. The lectures begin at 4 p.m.; no ticket of admission is needed.

A course of nine lectures in tropical hygiene nursing arranged by the County of London Branch of the British Red Cross Society will be given on Monday, Wednesday, and Friday afternoons at 9, Chesham Street, S.W.1, commencing on Monday, September 28th, at 5.30 o'clock. The fees for the course are 5s. to members of Red Cross and Voluntary Aid Detachments and 7s. 6d. for non-members, or 1s per lecture.

The opening meeting of the new session of the West London Medico-Chirurgical Society will be held on Friday, October 2nd.

A programme of post-graduate demonstrations has been drawn up by University College Hospital Medical School for the benefit of old students. On Thursday and Friday, October 15th and 16th, there will be demonstrations from 10 a.m. to 3 p.m. On Friday at 4.15 p.m., the annual general meeting of the Old Students' Club will be held in the Medical Society's Rooms in the Medical School followed at 7.30 p.m. by the annual dinner at the Hotel Victoria. The annual general meeting of the U.C.H. Women's Medical Association will be held on Friday, at 4.15 p.m., in the Women Students' Common Room at the Medical School, and the annual dinner at the Piccadilly Hotel at 7.45. The laboratories of the Institute of Medical Sciences, University College, will be open throughout these two days for inspection by old students.

The Fellowship of Medicine and Post-Graduate Medical Association announces the following courses: medicine, surgery, and specialties at the Metropolitan Hospital, Kingsland Road, E., from September 28th to October 10th, occupying the whole of each day; fee £3 3s., or £2 2s. for one week only. A similar course at the Prince of Wales's Hospital, Tottenham, from October 12th to 24th; fee £5 5s., or £3 3s. for one week. A course of lectures for the M.R.C.P. in the evenings, at 8.30, at the Medical Society of London, 11, Chandos Street, Cavendish Square, on Mondays and Wednesdays, beginning October 5th; fee £6 6s. for eighteen lectures, or 10s. 6d. per lecture, payable at the lecture room. Two special eye demonstrations will also be given, fee 10s. 6d. each; early application for these is essential. Diseases of the throat, nose, and ear at the Central London Throat, Nose and Ear Hospital, Gray's Inn Road, occupying the whole of each day, from October 5th to October 31st, and including a clinical course, fee £5 5s.; a pathology class, fee £5 5s. (limited); a peroral endoscopy class, fee £6 6s. (limited); and an operative class, fee £7 7s. (limited). Tropical medicine at the Hospital for Tropical Diseases, 25, Gordon Street, from October 5th to 24th, occupying the whole of each day; fee £8 8s. A course in diseases of the skin will be given at St. John's Hospital, Leicester Square, from October 12th to November 7th. Gynaecology will be the subject of a course at the Chelsea Hospital for Women, October 12th to 24th, fee £5 5s., and paediatrics at the Hospital for Sick Children from October 19th to 31st, fee £5 5s. As the latter course will not be held unless ten post-graduates enter for it, early application is desirable. A course in cardiology will be held at the National Heart Hospital from October 12th to 24th, fee £7 7s. Copies of syllabuses of all courses may be obtained from the Fellowship of Medicine, 1, Wimpole Street, W.1, also syllabuses of the series of free lectures and demonstrations for October, November, and December.

An illustrated talk on recent discoveries at Westminster Abbey will be given in aid of the King Edward's Hospital Fund for London on Tuesday, October 27th, at 5.30 p.m., in the Great Hall of Westminster School, by Mr. Lawrence E. Tanner, Assistant Keeper of the Muniments of Westminster Abbey. He will describe, with the aid of lantern slides, recent discoveries made at the Abbey. Tickets (5s. reserved, and 2s. 6d. unreserved) may be obtained from the secretary, King Edward's Hospital Fund for London, 7, Walbrook, London, E.C.4.

The new radiological pavilion and nurses' home extension at the North Middlesex County Hospital, Edmonton, will be opened on the afternoon of Tuesday, September 29th, by Alderman and Mrs. G. Marlow Reed.

The second centenary of the French Academy of Surgery will be celebrated at the Académie de Médecine on October 7th in the presence of the President of the Republic.

Owing to the economic crisis, the International Psycho-analytic Union has postponed to next year its congress, which was to have been held from September 7th to the 11th.

he second year in succession the Library Asso- at its annual conference, gave a session to the on of patients' libraries. The large hall in the ham Town Hall was filled with a keen audience of ons. The chairman, Lieut.-Colonel J. M. Mitchell, zed the very great potential importance of hospital to hospitals and to public libraries. In the past tish Red Cross and Order of St. John Hospital had rendered—and continued to render—a great but he considered that public libraries had not their part. To-day, with co-operation between and library authorities, it would be possible to go ay towards giving hospital patients the privileges s. Dean Inge then addressed the audience, and to this age as "a reading age." Those, therefore, nd themselves in hospitals were even more likely for books and to be benefited by them than in years. Moreover, he laid stress on the need for a hetic choice of books, both with regard to the al and to his disease. It was decided that the oss Hospital Library should continue, for the , to supply a library service for the London hos- voluntary and council), for mental hospitals, in- institutions, and sanatoriums, and for ex-service institutions; and it is hoped that as soon as , public and county libraries will, where the co- on of the hospital authorities is secured, provide vice for their respective non-infectious hospitals. ondence on the subject from doctors and public officers will be welcomed by the organizing ry, British Red Cross and Order of St. John l Library, 48, Queen's Gardens, Lancaster Gate,

he close of the second International Hospital Con- Vienna in June, representatives of the forty-one es participating agreed to organize an International al Association, with a view to the exchange of s on all sides of hospital work, and co-operation in ing necessary improvements. Membership com- national hospital associations and individuals or indirectly interested in their work; it will them to receive *Nosokomeion*, the official organ of ociation, and to participate in international hospital sses. Ten permanent committees have been set up ablish standards of different kinds for hospitals hout the world. Further information may be d from the general secretary of the International als Association, Dr. E. H. L. Corwin (2 E. 103rd New York), or from the British representative executive committee, Dr. J. Parlane Kinloch, rgh.

the sixth International Medical Congress on rial Accidents and Diseases, held in Geneva in ast, the council approved the request of repre- ves of sixteen countries for the formation of a section for life assurance medicine. The countries nted were Austria, Belgium, Czechoslovakia, rk, France, Germany, Great Britain, Holland, ry, Italy, Luxembourg, Norway, Poland, Spain, n, and Switzerland. A sectional executive com- consisting of Dr. Hörnen (Berlin), Dr. Otto May on), Dr. Goffin (Brussels), Dr. Coert (The Hague), sor Romanelli (Rome), Professor Bergstrand (Stock- and Dr. Kaufman (Zürich) was elected, with ornig as chairman and Dr. Kaufman as honorary ary.

srs. J. and A. Churchill announce for early publica- *Recent Advances in Materia Medica*, by Dr. J. H. director of the Pharmaceutical Society's pharmaco- laboratory; *Medical Emergencies*, by Dr. C. E. an; *Clinical Lectures in Psychological Medicine*, by Henry Yellowlees, *Diseases of the Kidney*, by Mr. irling Ball and Dr. Geoffrey Evans; and *Surgical logy*, by Messrs. C. F. W. Illingworth and B. M.

srs. Longmans announce for publication this month edition of Sir Frank Colyer's *Dental Surgery and logy*, revised and partly rewritten by Dr. Evelyn son.

The issue of *Deutsche medizinische Wochenschrift* for September 4th contains a sympathetic obituary notice of the late Professor W. E. Dixon by the co-editor and well-known pharmacologist, Dr. P. Wolff, who emphasizes the loss to the British Medical Association caused by his death.

An International Federation of Societies of Tropical Medicine and Hygiene has been constituted, under the presidency of Professor C. Achard, by the association of leading authorities on tropical medicine from twenty countries. At the invitation of the editorial committee of the *Revue pratique des Maladies des Pays Chauds*, various societies will exchange views on different subjects in order to bring into being a legal constitution for the International Federation.

The third Rumanian medical congress was held at Costanza from June 13th to 15th, when the following subjects were discussed: inoculation against tuberculosis, introduced by Dr. Cantacuzène; endemo-epidemic malaria, by Dr. Zotta; health legislation, by Dr. Gane; tuberculosis of the hip, by Dr. Balacesco.

The Minister of Health has appointed Captain D. W. Gunston, *M.C.*, M.P., to be his parliamentary private secretary (unpaid).

A cholera epidemic has recently broken out in Mesopotamia and has caused the loss of thirty lives.

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to **The EDITOR, British Medical Journal, British Medical Association House, Tavistock Square, W.C.1.**

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Correspondents who wish to be informed of their communications should enclose a stamped addressed envelope for their return, not necessarily for publication.

Authors' Reprints. REPRINTS of articles published in the *British Medical Journal* must be communicated with the Financial Secretary and Business Manager, British Medical Association House, Tavistock Square, W.C.1, on receipt of proofs.

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager.

The **TELEPHONE NUMBERS** of the British Medical Association and the *British Medical Journal* are MUSEUM 9961, 9962, 9963, and 9964 (four lines).

The **TELEGRAPHIC ADDRESSES** are:
EDITOR OF THE *BRITISH MEDICAL JOURNAL*, *Aitiology Westcent, London.*
FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements etc.), *Articulate Westcent, London.*
MEDICAL SECRETARY, *Medisecre Westcent, London.*

The address of the Irish Office of the British Medical Association is 16, South Frederick Street, Dublin (telegrams, *Bacillus, Dublin*, telephone 62550 Dublin), and of the Scottish Office, 7, Drumsheugh Gardens, Edinburgh (telegrams, *Associate, Edinburgh*; telephone 24361 Edinburgh).

QUERIES AND ANSWERS

Tonsils and Adenoid Operations

"DENTAL SURGEON" inquires for statistics showing the need for operation for tonsils and adenoids in children at the period between their third and fourth birthday anniversaries and also between their fourth and fifth.

Recurring Bruises

"X Y Z" asks for suggestions for treatment of the following case A girl, aged 22, fell down on March 11th, bruising and discoloration appearing on her left clavicle, left pectoral region, and the whole of the left arm No fracture revealed by x rays This cleared up completely On June 12th the discoloration reappeared in the same positions without further injury Again this disappeared, and later, on July 13th reappeared on the clavicle only, at about the middle of the clavicle there was also a small discharge of pus On July 17th the left eyelids were ecchymosed for the first time This latter feature has not reappeared, but there has been discoloration of the pectoral region and arm and forearm [illegible] vals since There is always definite pain [illegible] Coagulation time of blood is normal The patient had infantile paralysis affecting the left leg only, but uses it well, though underdeveloped.

Disturbed Sleep

Dr D J DRAKE (Rainham, Kent) writes in reply to "C M's" inquiry (September 12th, p 517) The patient surely has some error of refraction, probably myopic astigmatism, causing irritation of the nerve I should be interested to know the result of acting upon this suggestion

Dr H N HARNESS (East Finchley) writes In reply to "C M," with reference to the case of a young woman troubled with weeping and moaning in her sleep, I would suggest a careful palpation of the abdomen with a view to ascertaining if there is present any tonic hardening of the colon and if detected treat with liq hydrarg perchlor, tinct ferri perchlor, and tinct hyoscyam, 15 minims of each in an ounce of water three times daily, fifteen minutes before food In addition, I would insist on the patient reading for ten minutes to half an hour in bed some studious book on a subject devoid of emotional content, and one designed for instruction for preference The mysteries of space and time and the square root of minus one are wonderful promoters of dreamless slumber Reference to *Tonic Hardening of the Colon*, by Stacey Wilson (1927), will yield much food for thought

Income Tax

Expenses of "Study Leave"

"C H," who is an officer in the Indian Medical Service, and is on study leave (with allowance), inquires whether he is entitled to an allowance for income tax in respect of (1) purchase of books, (2) class fees, (3) examination fees and (4) use of a car during the work done

*** To be allowable, the expenses must be incurred wholly exclusively and necessarily in the performance of the duties of the office It seems to us that the particular expenses were incurred partly, if not entirely, in the improvement of C H's" knowledge and professional ability—that is in order that his duties in future might be extended or more efficiently performed From that aspect there is a substantial element of capital outlay included in the expenditure and we do not think that he would be successful in a claim to treat them as expenses of his office for tax purposes

Cash Basis

"L" writes A and B were in partnership up to July 31st, 1931 when A sold his one half share to C For 1930-31, A and B have been assessed on one third of the 1929 cash profits and B and C on two thirds The cash basis is to continue A's share of the former partnership's cash profits being brought into the calculation The inspector of taxes has required B and C to give an undertaking that when their partnership ends the outstanding debts will be brought into the calculation of their final liability

*** Clearly B and C have the worst of the bargain, in that they will ultimately pay on more than the amount of their income from the practice A is not liable in respect of any cash received after 1929-30 such receipts representing to him the gathering in of past taxed profits The correct legal course would be for the cash basis to be discarded after July 31st 1930 and for B and C's liability after that date to be computed by reference to the amount of *their* cash receipts in the period plus the increase in the amount of *their* outstanding book debts The undertaking which they have given seems to us a high price to pay for the convenience of the cash basis method of calculation.

Sickness and Accident Insurance

"A B S" points out, in connexion with a recent reply that of a total amount of £20 per annum paid by him as premium on a sickness and accident policy, £6 has been allowed for income tax purposes as representing life assurance

*** This is a point which should certainly be borne in mind Although no allowance is due for "sickness" premiums, that portion of the total payment which refers to the death risk benefit ranks as a life assurance premium for income tax purposes The proportion of the whole payment so allowable naturally varies with the terms of the policy, but the company concerned will, on request give a certificate of the allowable amount

LETTERS, NOTES, ETC.

Infantile Diarrhoea

Dr W C CHAFFEY (Hove) writes I venture to make a few additions to the treatment suggested by Dr A V Neale (August 29th, p 382) During many years of hospital and private practice I have found that most cases are benefited by the administration in the first instance of small (1/12 grain) doses of calomel, repeated at two hourly intervals for six doses, and followed by tannigen (1 grain) in an emulsion of castor oil (5 minims), with a little syrup and aqua anethi All milk should be stopped and not be given again for several days I have been accustomed to administer meanwhile barley water with a little mint juice, or Benger's food made with water, also, it may be necessary to administer a few drops of brandy occasionally

Phimosis and Circumcision

Dr J B JESSIMAN (Malvern Link) writes Recently my time has been so much occupied in doing circumcisions that I have had no leisure in which to reply to Mr Snudden's article in the *Journal* of July 4th I do hope and believe that most practitioners do not agree with his opinions regarding the undesirability of circumcision Indeed I imagine most of us nowadays advise circumcision practically without exception, primarily because the foreskin is a dirty useless, harmful, unhygienic rag, which was doubtless a very necessary protection to our hairy ancestors with their tree climbing propensities One advises circumcision in practically every male child, no matter what age even if easy retraction of the prepuce is possible Why should one wait for balanitis, phimosis, etc? These indications are due to accumulation of smegma, a tight prepuce, or adhesions one or all, are trivial matters in themselves but the end results are far from being so—for example enuresis convulsions ruptures, and, above all masturbation In my less enlightened days I used the dilating process exactly as described, but it was such a crude, cruel, and unsatisfactory proceeding that I promptly gave it up Most prepuces are rather inelastic, and no matter how gently one manipulates there is on subsequent treatments Circumcision means sixty seconds of pain at most, and the job is finished, not simply tinkered with If done six from three to fourteen days after birth no anæsthetic is necessary —in practice one finds it so Apparently the sensory nerves in the prepuce at that time are not very receptive The child suffers far less shock and pain with one snip of the scissors than from repeated stretchings, which are simply periods of prolonged agony

Dr Bendien's Work on Cancer

Mr ROY R KERR, I HCS (Manchester), writes As great misconceptions have arisen as the result of the sensational writing up of a few minutes' telephone conversation by one of the Sunday papers, I should be very much obliged if you will let me make it perfectly clear that I have arranged with Dr Bendien to carry out certain clinical tests of his [illegible] in my hospital practice This work on my part is purely experimental, and I have no intention whatsoever of using it generally or in private cases unless or until I am completely satisfied as to its value

Vacancies

Notifications of offices vacant in universities, medical colleges and of vacant resident and other appointments at hospitals will be found at pages 42, 43, 44, 45, 46, 47 and 50 of our advertisement columns, and advertisements of partnerships, assistantships, and locumtenencies at pages 48 and 49

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page 183

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

226 Delayed Symptoms in Pneumoconiosis

J. A. BRITTON and J. R. HEAD (*Journ. Amer. Med. Assoc.*, June 6th, 1931, p. 1938) report four cases of silicosis, or silicosis and tuberculosis, which developed many years after relatively short exposures. One patient showed symptoms of silicosis twenty-three years after an exposure of only four months; in the second they developed ten years after an exposure lasting for two years; in the third an interval of fourteen years elapsed before an exposure of four years caused any manifest effect; and in the fourth case there was a free period of ten years before an exposure to infection of ten years gave rise to extensive pneumoconiosis associated with tuberculosis. The authors remark that these instances suggest the necessity of revising the conception of the length of exposure required to produce the disease. They think it probable that after relatively short exposures sufficient dust is deposited in the lungs to set up a progressive fibrosis; only after several years does this condition become sufficiently extensive to cause symptoms. Alternatively, it may be that the dust alone does little harm until it becomes associated with some kind of additional infection. In either case it is obvious, they urge, that statistics compiled from groups of men still engaged in the industry cannot indicate the length of exposure necessary to produce the disease. This complicates seriously the question of insurance compensation, and the authors doubt whether claims in such cases would be met. In their patients there was a rapid onset of the symptoms following pulmonary infections, but they maintain that the disease itself takes as a rule a long time to develop. It is therefore unwise to assume that a lengthy period of exposure is necessary before real harm can result. In all the authors' cases the intervening period between the exposure and the appearance of symptoms was entirely healthy, and it was clear that cessation from the work in dusty atmospheres had done nothing to arrest the process which had then begun.

227 Multiple Etiology of Hay Fever Attacks

Though information concerning hay fever has greatly increased during recent years, the results of treatment are at times disappointing. H. H. GELFAND (*Amer. Journ. Med. Sci.*, July, 1931, p. 81) suggests that some other sensitivity than that to pollen may be the cause of a certain percentage of failures. Reports of four cases are presented that tend to show that this multiple hypersensitivity is a most important factor, and should seriously be considered in the treatment of seasonal hay fever. In one case the patient suffered from hay fever whenever she ate beef or pork. All such patients who resist desensitization to the specific pollen should be tested also for other inhalant irritants and food allergens. When found sensitive to inhalant proteins, desensitization before as well as during the hay fever season is necessary. If one special food is indicated, this should be eliminated from the diet during the hay fever season.

228 Cerebral Symptoms in Typhoid Fever

J. STÉHELIN (*Thèse de Paris*, 1931, No. 247), who records ten illustrative cases, four of which are original, in patients aged from 10 to 36, states that numerous and varied symptoms of cerebral origin may occur in typhoid fever, indicating a diffuse involvement of the brain, all the regions of which may be affected separately, together or successively. Two principal forms of typhoid encephalitis may occur—namely, encephalo-typhoid with intestinal symptoms, and typhoid fever with cerebral manifestations. The intensity of the cerebral reaction in typhoid fever ranges from the ordinary nervous typhoid syndrome to the severe ataxo-adynamic nervous forms. Occasionally the morbid process shows a remarkable intensity and unusual symptoms appear. Typhoid encephalitis in such cases shows a predilection for some definite area of the brain, the most characteristic being the bulbar, cerebello-spastic, and mesocephalic forms. The bulbar form, which is particularly severe, is chiefly encountered at the onset, while the mesocephalic form, which is met with at the height of the disease, is ushered in by muscular hypertonus, and accompanied by paralysis of the cranial nerves, often terminating with bulbar symptoms. Hypertonus, therefore, is a very valuable prognostic symptom, and should be systematically investigated in typhoid fever.

229 Post-vaccinal Encephalomyelitis in Australia

L. LOCKWOOD (*Med. Journ. Australia*, May 30th, 1931, p. 662) records the first example of this condition to be reported in Australia. The case, which occurred five years ago, was in a stoker, aged 19, in whom the symptoms developed twelve days after successful primary vaccination. The symptoms were complete loss of all forms of sensation and flaccid paralysis in both legs and lower part of abdomen, delirium, and broncho-pneumonia. Death took place. The diagnosis at the time (1925) was broncho-pneumonia and myelitis, but the condition is now thought to have been post-vaccinal encephalomyelitis.

Surgery

230 Diagnosis of Abdominal Tumours

Until recently the only method of showing up certain abdominal tumours by means of *x* rays has been the introduction of air into the peritoneal cavity by Rautenberg's method. Radt, however, has recently produced a thorium dioxide preparation which is selectively absorbed by the reticulo-endothelial system, and is opaque to *x* rays. By means of the intravenous injection of this substance, the liver and spleen can be shown up in sharp contrast to the other abdominal organs. As an illustration of the use of this method, E. E. BAUKE (*Deut. med. Woch.*, July 3rd, 1931, p. 1148) records the case of a man, aged 62, in whom a sub-diaphragmatic tumour, apparently calcified, was discovered accidentally on radiographical examination. The situation of the tumour was uncertain, but after the injection of 60 c.cm. of thorium dioxide-sol in five doses at intervals of one to two days the liver and spleen were clearly outlined, and the tumour was found to be centrally placed in the latter organ. Since the mass was giving rise to no symptoms, and was not detectable on clinical examination, no operation was performed, and its exact nature was not decided. In all probability it was a calcified hydatid cyst or solitary tubercle.

231 Appendicitis in Children

The problem of appendicitis in children differs from that in the case of adults for various reasons, such as the difficulty in obtaining satisfactory histories, in making physical examinations, and in interpreting the findings. L. W. TASCHE (*Amer. Journ. Med. Sci.*, July, 1931, p. 86) records a study based on 111 appendicectomies performed on children during a period of nine years. Acute appendicitis is rarely seen before the age of 3; its incidence then increases, and it is especially prevalent after 7. In children it occurs slightly more often in males than in females; the peak seasonal incidence is in the autumn. All the children concerned were under the age of 13, the youngest being 2½ years old. There was a history of one or more previous attacks in 31 per cent., and of recent previous infection elsewhere in the body in 13 per cent. A fair degree of direct correlation was noted between the clinical picture and the surgical and pathological findings;

the degree of correlation, however, is occasionally poor. The highest leucocyte counts were found in the cases with abscess formation and with diffuse peritonitis; leucopenia was of grave significance, and usually indicated a fatal termination. Abnormal urinary findings were present in 19 per cent. of the cases; none of these patients was operated upon until urinary disease was eliminated. The mortality percentage was 6.3, the most frequent cause of death being diffuse peritonitis. The interval between the onset and the time of operation is held by the author to be probably the most important factor in determining the prognosis and pathology; consequently, early diagnosis with immediate appendicectomy offers the best hope for recovery.

232 Treatment of Empyema

Drainage of an empyema by suction through an airtight tube is obviously desirable in order to restore the normal relations of pleura, lung, and heart, but the methods at present in use lead to difficulty in dressing the wound, infection of the skin, and development of fistula. Moreover, in changing the dressings renewed air entry into the pleura is liable to occur. For these reasons K. WALZ (*Zentralbl. f. Chir.*, July 11th, 1931, p. 1789) adopts the following technique, which he claims to be very successful. Under local anaesthesia an incision 8 to 10 cm. long is made in the posterior axillary line, and 4 to 5 cm. of rib is removed subperiosteally. Before opening the pleura a tunnel is made with forceps from the wound through the muscle to open on the skin about 8 cm. in front of the wound. A rubber tube is introduced through the tunnel, and its inner end is inserted through a small puncture into the pleura. While the pus is draining through the tube, the wound is stitched up in layers with fine catgut. A rubber sleeve can be fitted round the tube where it leaves the skin, and be secured by pins to strapping on the chest wall. The tube is connected with a suction apparatus until the end of the treatment, and is only removed when no pus has come away for several days. The wound heals readily, and only four or five changes of dressing may be necessary. This makes for the greater comfort of the patient, who is able to move much more freely than is usual after empyema operations.

233 Subcutaneous Emphysema following Aspiration of Foreign Body

P. P. VINSON and H. J. MOERSCH (*Minnesota Med.*, July, 1931, p. 654) report three rare cases of subcutaneous emphysema following the passage of a foreign body into the respiratory tract. In the first case a boy, aged 6, aspirated a metal paper-clip into the right bronchus. An *x*-ray examination revealed partial atelectasis of the right lung; there was a moderate amount of subcutaneous emphysema over the front of the right side of the thorax and neck, the condition completely clearing up after removal of the clip. In the second case there was obstruction of the right main bronchus of a boy, aged 3, and marked subcutaneous emphysema with air in the pericardial cavity ten days after the aspiration of a pea-nut; part of this was removed and the remainder was expelled spontaneously. Upon discharge four days later the subcutaneous air had disappeared, and that in the pericardial cavity had greatly diminished; a fortnight later the child was reported well. In the third case, a girl aged 2½, after aspirating a pea-nut developed subcutaneous emphysema of the upper part of the thorax and neck, which increased with each spell of coughing. An *x*-ray examination revealed the kernel in the right bronchus; after its removal the child was placed in an oxygen chamber, but after twenty-four hours tracheotomy had to be performed. The tube was removed five days later, and a fortnight after admission the child was discharged. In the first case the condition was accounted for by the point of the paper-clip piercing the bronchial wall during coughing; in the second and third cases the foreign body caused an obstructive emphysema with rupture into the mediastinal and subcutaneous tissues, though the presence of air in the pericardial cavity in the second case is difficult to explain.

Therapeutics

234 Protein Therapy in Colitis

H. A. RAFSKY (*Med. Journ. and Record*, July 1st, 1931, p. 35) reports good results in non-specific colitis from the intramuscular injection of "aolan," which is a colloidal lactalbumin solution prepared from milk and freed from toxins and bacteria. The initial dose was 3 c.cm.; this was gradually increased up to 10 c.cm. The injections were given twice a week for two months, and were continued subsequently once a week, once a fortnight, or once a month, according to the clinical progress. The average length of time required by the treatment was six months, but 90 per cent. of the patients showed marked clinical improvement at the end of three weeks. There was, however, little radiographical evidence of healing in under six or seven months. Spastic contractions quickly yielded to the treatment, and the usually low blood pressure was raised. As a preliminary the patients must be tested for protein sensitization by the intradermal route. In making the therapeutic injections care must be taken that the needle does not enter a vein; the gluteal region is the preferable site, and the injections should be given slowly while the patient is fasting, or after a light meal. While Rafsky is not yet certain as to the final permanency of the benefit, he states that 75 per cent. of the patients in his series had remained free from symptoms so far for an average of eighteen months.

235 Insulin in Ulcus Cruris

J. GATÉ and P. BARRAL (*Ann. de Derm. et de Syph.*, June, 1931, p. 665) record some gratifying results in the treatment of chronic non-syphilitic ulcers of the leg by insulin; moreover, in a refractory syphilitic case the alternation of insulin, mercuric cyanide, and neosalvarsan injections proved successful. In several diabetic cases chronic ulcers healed rapidly under insulin treatment; it was also found that insulin cured ulcers in patients who had hyperglycaemia without glycosuria. One ulcer which had existed for fourteen years healed in a few weeks. Some investigators have suggested the application of insulin powder mixed with lactose; others recommend insulin ointment. Neumarck has reported that insulin has a remarkable trophic action when it is injected hypodermically around the margin of the ulcer. Gaté and Barral prefer daily hypodermic injections of 15 units of insulin; if improvement follows, this treatment is maintained until cicatrization is complete. In some cases it is advisable to continue the injections at longer intervals after recovery, rather than to cease treatment abruptly. Insulin is especially useful in ulcers occurring in patients whose carbohydrate metabolism is deranged, and in some cases of syphilitic or varicose ulceration it proved to be a useful adjuvant when ordinary treatment had failed to evoke a cure. Increased oral administration of sugar is advisable in refractory cases. It is not claimed that insulin is a panacea; some ulcers improved temporarily, but insulin then appeared to lose its effect.

236 Salicylate Acidosis

H. BÉNARD and F.-P. MERKLEN (*C. R. Soc. de Biologie*, July 3rd, 1931, p. 973) record a case of rheumatism treated with sodium salicylate in which coma with Kussmaul's respiration, considerable lowering of the alkaline reserve, and the appearance of ketone bodies in the urine occurred. These symptoms subsided on abandoning the salicylate treatment, and administering large doses of sodium bicarbonate. As the result of further study the authors conclude that such cases are relatively rare, and occur only when large, repeated doses of salicylates are employed; such ill-effects can be avoided by the association of equal or double doses of the bicarbonate. A certain individual idiosyncrasy is apparently also present. Distinction must be made between salicylate acidosis and intoxication. The possibility of this acidosis arising should be considered in salicylate treatment, and intensified bicarbonate medication should be administered on its appearance.

Ophthalmology

237 The Calcium Metabolism in Cataract

Contrary to the observations of those who believe that *parathyroid treatment benefits cataractous lenses*, D. B. KIRBY (*Arch. of Ophthalmol.*, May, 1931, p. 754) shows that the calcium metabolism in patients with cataract falls within the normal limits. It was thought in these cases that the blood calcium was increased, that there was a higher calcium content in the aqueous fluid, and that, therefore, the exhibition of parathyroid extract would assist in the elimination of the lenticular calcium. Kirby points out that there is no relation between the cataract of tetany and of senile cataract. As the calcium excretion is increased by parathyroid therapy, so the blood calcium figure is raised; the loss of calcium is at the expense of bone, and this storehouse will be depleted before any removal is effected from the lens. The author used injections of parathormone (which he considers the most potent and reliable form of extract) in fourteen cases, for periods varying from five days to six months, but, with the most careful observation, there was either no change or else an increase in the cataract. That a cataract remains stationary is no evidence of removal of existing opacities or the prevention of the formation of new ones, since this is a normal episode in the history of many cataracts.

238 The Use of Adrenaline in Progressive Myopia

M. WIENER (*Amer. Journ. Ophthalmol.*, June, 1931, p. 520) reports that through further experience he has confirmed his previous impression that the persistent application of adrenaline solution to the eyes tends to inhibit the progressive development of myopia. In his preliminary report on the use of this preparation in progressive myopia he expressed the belief that its exhibition, *if associated with an effort to increase the secretion of* the suprarenals by urging strenuous exercise, tended to check the progress of the condition. With further experience he is now more assured that it exerts a favourable influence on myopia of the progressive type. Since that report Incze has stated that myopia is not a disease *per se*, but is a manifestation of a universal congenital asthenia. This constitutional peculiarity of the sclera, the weakness of an asthenic mesenchymal derivative, especially affecting the elastic elements of the sclera, permits the stretching of the globe, and thus the myopic change of refraction. Incze believes that in this scleral stretching another phenomenon of asthenia plays its part —namely, deficiency of adrenaline in the organism, in addition to an altered condition of the endocrine function in general. He considers that age and occupation play no part. Wiener, contrary to Incze, found from the observation of 159 cases that age was a factor in the development or progress of myopia; with few exceptions, the patients were of school age, also they were all inclined to be of the well-nourished type, rather than the type which he described as "asthenic." Some of the cases showed little or no progress during the whole time of treatment. A few improved, and several developed an increase in visual acuity even though the refraction did not change. Even in the cases that progressed unfavourably, the condition seems to have increased less than before the use of adrenaline. The author concludes that there is a certain type of progressive myopia which is favourably *influenced by exercise and the local institution* of adrenaline. On the other hand, another type definitely suggests the presence of some other factor, the nature of which is not yet clear.

239 Miners' Nystagmus

W. J. ROCHE (*Brit. Journ. Ophthalmol.*, April, 1931, p. 211) suggests that miners' nystagmus is a non-organic disease, in which the co-ordinate movements of the body, and particularly of the eyes, are deprived of their co-ordination in consequence of changes in the afferent impulses received from the eyes and internal ear; altered reflex efferent impulses are therefore transmitted to the musculature. These efferent impulses are changed in frequency and amplitude, and so the normal tone of the muscles is *modified*. In order to adapt the eye to poor illumination the efferent sensations travelling to the iris sphincter and ciliary muscle are inhibited, the sympathetic fibres are stimulated, *the stimuli producing convergence* are augmented, and, as a result, the amount of nervous energy required for inhibition and stimulation is much increased. The peripheral visual apparatus which is being used for form vision becomes fatigued; the oculomotor system tires, and may be disorganized by the abnormal inhibitions and stimulations. As a result of these altered sensations in the visual apparatus, oculomotor system, and internal ears, the co-ordinating function of the posterior longitudinal bundle is very much affected. Roche adds that alteration in sensation occurs in both internal ears in nystagmus, and discusses the way in which this is brought about. He concludes with recommendations *for improving the lighting in mines*, and adds that the sons of nystagmus patients should not be employed underground.

240 Lagleyze-Von Hippel Disease

J. L. PAVIA and M. DUSSELDORP (*Rev. Oto-Neuro-Oftalmol. y de Cir. Neurol.*, May, 1931, p. 189) report a case of this condition, of which only twenty to thirty examples are recorded. Its characteristic features are as follows: (1) a change in the retinal vessels, which become extremely sinuous, increase in size, and anastomose with one another; (2) the presence of small reddish globules varying in number and size, which appear to be superficial haemorrhages or aneurysms, and into which the sinuous vessels enter (these two changes first appear as a rule at the periphery of the fundus); and (3) the formation of white spots disseminated over the posterior pole of the retina, which becomes thickened. The disease begins in early life, vision being preserved for a long time. Blindness ensues after many years owing to extension of the lesions throughout the retina. Histologically there is proliferation of the capillaries and neuroglia, with destruction of the rods and cones, and formation of cystic spaces. The etiology is unknown, and no treatment is of any avail. Many cases have terminated fatally owing to the development of vascular tumours in the cerebellum. Post-mortem tumours or cysts are frequently found in the pancreas, kidneys, and suprarenals. The present case occurred in a man aged 25, and the issue is not recorded.

Obstetrics and Gynaecology

241 The Occipito-Posterior Position

S. M. DODEK (*Journ. Amer. Med. Assoc.*, May 16th, 1931, p. 1660) reports a study of the occipito-posterior presentation, one of the most serious obstetrical complications. It occurred in 514 (29.8 per cent.) of 1,723 cases of vertex presentation during 21 months at the Cleveland Maternity Hospital, and accurate diagnosis is important for its proper management. Abdominal palpation and auscultation with rectal examinations and a close observation of the course of labour are excellent diagnostic aids; vaginal examination is rarely necessary. Only few foetuses in persistent occipito-posterior positions will rotate spontaneously after 2 to 2½ hours of second stage labour, and foetal loss from intracranial haemorrhage after three hours of this stage warrants correction of the *position and* delivery. Internal podalic version is held to be the best method when the greatest diameter of the foetal head is arrested at the pelvic brim. The persistent occipito-posterior foetus which has descended below the pelvic brim should be rotated by the *modified* Scanzoni manœuvre of Bill. Some foetuses after rotating 90 degrees remain in the transverse diameter of the maternal pelvis; completion of rotation with forceps extraction is recommended in these cases. Manual rotation is unwise because of complications due to displacement and manipulation of the head. Delivery in the persistent occipito-posterior

position is dangerous to the child, and unnecessary. In the present series of cases only one was delivered in this position, and eighteen by Caesarean section. The mortality for full-term infants from all causes was 3.9 per cent.; pulmonary emboli caused the only two maternal deaths.

242 Diagnosis of Carcinoma of the Corpus Uteri

TIXIER and POLLOSSON (*La Gynécol.*, May, 1931, p. 298) from a study of thirty-one cases of carcinoma of the body of the uterus draw the following conclusions. A patient with post-menopausal uterine bleeding, if she has not a cervical carcinoma, has almost certainly one of the body of the uterus. The first sign of this consists in bleeding, continuous rather than intermittent, and scanty rather than profuse; pain comes later. The general health remains good for a considerable time, and slight fever, up to about 100.5°, is common. At an early stage bimanual examination is more often deceptive than useful in diagnosis. Both the cervix and body of the uterus usually appear small and mobile; the fornices are supple, and the parametria free. Intrauterine manœuvres, such as dilatation, curetting, sounding, biopsy, and lipiodol injections, are dangerous in old patients whose symptoms point to cancer of the body; the cavity is intensely septic and the wall friable. In younger patients, in whom, however, carcinoma of the body is rarer, exploration of the uterus is invaluable in the differential diagnosis from placental retention, chorion-epithelioma, and intrauterine polypus. If post-menopausal haemorrhage is met with in a patient having a uterine myoma, the existence of the latter is no excuse for taking no action; the haemorrhage points to carcinoma of the artery, if not of the corpus uteri.

243 Urinary Incontinence following Childbirth

H. W. JOHNSTON (*Surg., Gynecol. and Obstet.*, July, 1931, p. 97) describes an operation for the distressing urinary incontinence which so frequently follows childbirth. The condition depends on displacement of the upper part of the urethra—namely, that part held in position by the triangular ligament, and surrounded by the sphincter urethrae. If the latter is torn, sagging of the upper part of the urethra occurs, and the urethra becomes displaced, with consequent incontinence. A few operations, performed for the relief of this condition, are briefly reviewed. Johnston believes that cure can be obtained by bringing into apposition the torn ends of the sphincter urethrae muscle. With the patient in the lithotomy position, a catheter is introduced into the bladder, and gentle traction causes the neck to come into view. The anterior vaginal wall is medially incised, and the flaps are reflected laterally. Below the neck of the bladder the deep layer of the trigone can be seen, and by careful dissection the torn ends of the sphincter can be isolated and freed. The catheter is withdrawn and the torn muscle ends sutured, the deep layer of the trigone being included in the first stitch. The redundant vaginal mucosa is then excised. Haemorrhage, always troublesome, must be controlled and the field left dry. A permanent catheter is introduced and retained for four days. The patient is given 5 grains of urotropine thrice daily, and is kept in a semi-sitting position. Of six cases observed for three to twelve months after having been treated by this method, cure ensued in five; the remaining cases failed owing to separation of the stitches due to an infected haematoma.

244 Diagnosis of Neo-natal Fracture of the Clavicle

Clavicular fracture occurs in 1 per cent. of all births, and H. N. SANFORD (*Amer. Journ. Dis. Child.*, June, 1931, p. 1304) commends the Moro reflex for its diagnosis. On placing an infant on a table, and then forcibly striking the table on either side of the child, a motor reaction is obtained. The arms are suddenly thrown out in an embrace attitude, describing an arc, and tending to approach one another with a slight tremor; the fingers are at first spread and then closed. Sanford tested this reflex on 465 newborn infants during the first ten to fourteen days of life. There were several conditions in which the reflex was absent symmetrically for various periods of time during the first ten days, but there were no cases in which it was asymmetrical for more than the first twenty-four hours, except in fracture of the clavicle. On the side of the fracture there was no response for the first two weeks, until the callus was well formed. There were no cases of unilateral brachial palsy in this series, but other observers have noticed that these cases react in exactly the same way as fractures of the clavicle.

Pathology

245 The Haematology of Certain Leukaemias

M. LABBÉ, R. BOULIN, and M. PETRESCO (*C. R. Soc. de Biologie*, June 19th, 1931, p. 657) have found that the phenomenon of splenic contraction following the administration of adrenaline (the test of Weil and Isch-Wall), though needless in typical cases of acute leukaemia, is of great diagnostic value in certain doubtful ones—for example, those showing a low, practically normal leucocyte count, an intense anaemia, and numerous normoblasts and megaloblasts. The haematological reactions in two cases fifteen minutes after the intramuscular injection of 1 mg. of adrenaline were as follows: a slight hyper-erythrocytosis of about 250,000; a marked hyperleucocytosis, usually double that figure; the appearance of young cells (haemohistioblasts and haemocytoblasts) not seen in earlier examinations; and an increase in those previously found. A rare reaction noted was an increase in the myeloblasts with Auer's bodies after the injection; this diminished if the injection was repeated in twenty-four hours, but again increased on its repetition after some days. The slight erythrocytic reaction must not be considered as an absence of reaction, but as an index of the degree of myelomatous or lymphomatous invasion of the spleen to the detriment of the red pulp. This reaction approaches normal in proportion to the splenic invasion, and is weak or absent as the myelomatosis or lymphomatosis becomes more complete.

246 Cultivation of Vaccinia Virus from Human Lymph

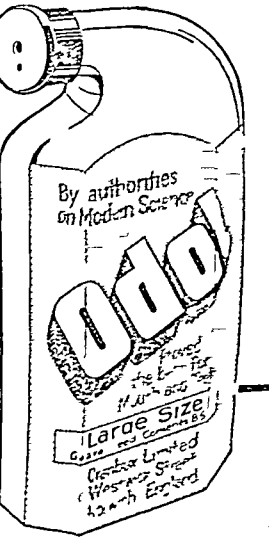
E. G. NAUCK and E. PASCHEN (*Zentralbl. f. Bakt.*, July 13th, 1931, p. 312) report the cultivation *in vitro* of the vaccinia virus from a specimen of human lymph. The lymph, which came from the 62nd arm-to-arm passage, was put up in tissue culture with spleen or testicle, heparinized plasma, and tissue extract. Incubation and subcultivation were performed under the usual conditions. Titrations were made on the third, fourth, and sixth passages, using the rabbit's cornea, and it was found that multiplication of the virus had occurred. This appears to be the first time that direct cultivation from human lymph has been performed.

247 Infectivity for Monkeys of a Typhus-like Disease at Toulon

MARCANDIER, PLAZY, LE CHUITON, and R. PIROT (*Bull. Acad. Méd.*, June 23rd, 1931, p. 1012) have studied an exanthematic fever observed on board certain ships at Toulon. This fever appears to be similar to the exanthematic fever of Marseilles, the close relationship of which to true typhus is now generally recognized. Blood was taken from three patients, each of whom gave a positive Weil-Felix reaction in a titre of 1 in 640, and was inoculated intraperitoneally in 8 to 15 c.cm. doses into *Callithrix* and *Cercocebus* monkeys. Of four monkeys inoculated three developed fever about eight or nine days later; when tested two or three months later for their resistance to the true typhus virus—by intraperitoneal inoculation of one-thirtieth of the brain of a guinea-pig on the third day of illness—they were found to be immune. The fourth monkey did not develop fever, and was later found to be susceptible to the typhus virus, as were also two control monkeys. The disease conferred by the inoculation of the monkeys with the blood of patients was successfully passed on to two further monkeys, each of which developed an immunity to typhus. Judging by the immunity test, therefore, the authors conclude that the exanthematic fever of Toulon is an attenuated form of true typhus.

THE 6 REQUIREMENTS OF THE PERFECT MOUTHWASH & GARGLE

★ Requirement No. 2



One of the outstanding virtues of Odol is that it wholly fulfils the second all-important essential of the perfect hygienic mouthwash, viz., it is non-irritant to the mucous membrane. Odol is non-caustic, being perfectly non-injurious to the mucous membrane, and non-irritant. Odol is peculiarly suited to the condition of the oral cavity, for its antiseptic is mild. Odol is innocuous, and is promptly absorbed by the mucous membrane. It is immediately effective where most wanted, i.e., where fermentation and decomposition processes are taking place.

All Six Requirements are fulfilled by

Odol

The Six Requirements

1. It must be absolutely harmless.
2. ★ It must be absolutely non-irritant to the mucous membrane of the mouth
3. It must be definitely antiseptic.
4. It must be neutral in reaction.
5. It must be deodorising and refreshing.
6. It must be agreeable to the taste

Samples and literature will be gladly sent to any member of the Medical Profession in the British Isles or the Irish Free State on request to Cranbux Ltd of Norwich.

BRITISH MADE BY BRITISH LABOUR
FINANCED BY BRITISH CAPITAL

Comfortable, and Correct Support

Assured to all sufferers from abdominal ptosis who wear the Curtis Abdominal Support, Model No. 1. The principle of this support—that of anterior posterior support—has been proved by scientific research to be the most efficient. There is no circumferential pressure, hence the wearer's freedom of movement is in no way restricted. There is no cramping or binding of the hips. It is light in weight, and easy to apply. There are no complicated fastenings.

IN USE IN MOST OF THE LONDON HOSPITALS.

Everything to look for on a Bottle..

IMITATION may be the sincerest form of flattery, but the extent to which the U.G.B. Medical Bottle is imitated in inferior quality is far from gratifying.

Designed some ten years ago as an ideal dispensing bottle, it is now the standard for this purpose. The consistently high quality, accurate capacity and attractive appearance, places the U.G.B. Medical in a class by itself.

The success of this bottle has been greatly enhanced by the introduction of the "WASHED & STERILIZED READY-TO-USE BOTTLE" packed in non-returnable Dustproof Solid Fibre Cartons—supplied either for Corks or complete with Rustless White Enamelled Screw Caps.

Obtainable from all leading Wholesalers.

SURGICAL BELTS ALONE DEAL WITH THE ROOT CAUSES OF INTERNAL DISPLACEMENTS

The mechanical engineering of the abdomen in cases of internal displacement is now the first concern of patient and physician. X-ray photographs reveal irrefutably that aperients and intestinal antiseptics are futile in such cases. The long and frequently disappointing records of surgical intervention of a formidable and dangerous kind, show clearly how little this form of treatment achieves. The medical profession is beginning to realise that the surgical belt—giving upward support—can alone deal successfully with the root cause of mankind's tendency to sag—the downward pull of gravitation.

Domen surgical belts are constructed to give ample upward support from the only anatomically legitimate foundation—the pelvis. And they do this without harmful pressure—without embarrassment to the patient. Domen belts are designed for specific complaints and are strong, durable and light. Full information will be sent on receiving your card or a telephoned request.

TO COUNTER ACIDOSIS

As SALVITAE contains 59% of Potassii et Sodii Citro Tartras and 30% of Sodii Sulphas it is of great value both in maintaining health and in the treatment of disease, through eliminating deleterious nitrogenous products and favourably influencing circulation, glandular secretions, peristalsis, and metabolism.

The fruit acids of SALVITAE are converted in the system into potentially basic alkaline carbonates, thus enabling the blood to keep the uric acid compounds in solution, and facilitate their removal.

RATIONAL REPETITION IN THE TREATMENT OF RHEUMATISM

For many years Pistany has been appreciated by the Medical Profession for its great work in the cure of Rheumatism

The properties of Pistany's hot volcanic soft mud are quite peculiar. Its power of stimulating and increasing the absorption of pathological products is still unrivalled.

The treatment may be continued by the patient after returning from the Spa, under his own doctor's supervision by means of the Mud Packs, which are in use in many rheumatism clinics in this country.

ST. ANDREW'S HOSPITAL

FOR MENTAL DISORDERS,

NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY.

President: THE MOST HON. THE MARQUESS OF EXETER, C.M.G., A.D.C.

Medical Superintendent: DANIEL F. RAMBAUT, M.A., M.D.

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients, who are suffering from incipient mental disorders or who wish to prevent recurrent attacks of mental trouble, temporary patients, and certified patients of both sexes, are received for treatment. Careful clinical, biochemical, bacteriological, and pathological examinations. Private rooms, with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE.

This is a Reception Hospital in detached grounds, with a separate entrance, to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods, including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical bath, Plombières treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray Room, an Ultra-violet Apparatus, and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological, and pathological research.

MOULTON PARK.

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit, and vegetables are supplied to the Hospital from the farm, gardens, and orchards of Moulton Park. Occupation therapy is a feature of this branch, and patients are given every facility for occupying themselves in farming, gardening, and fruit growing.

BRYN-Y-NEUADD HALL.

The seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres, at Llanfairfechan, amidst the finest scenery in North Wales. On the North West side of the Estate a mile of sea coast forms the boundary. Patients may visit this branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses, and bowling greens. Ladies and gentlemen have their own gardens, and facilities are provided for handicrafts, such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 56, Northampton), who can be seen in London by appointment.

HAYDOCK LODGE,

NEWTON-LE-WILLOWS, LANCASHIRE.

FUNCTIONAL NERVOUS DISORDERS, MEDICAL & CONVALESCENT CASES.

An approved Nursing Home for reception of Female Cases under the Mental Treatment Act.

The Home is a Mansion of Historical interest, standing in 9 acres of garden and grounds, and is situated 14 miles from Northampton, and 12 miles from Bedford on the main London to Northampton Road, fifty miles from London. Both sexes are accommodated. Psycho-Therapeutic Treatment is used extensively in suitable cases. Radiant Heat, X-Ray, and Ultra-violet Light. Diathermy and Foam Baths. Billiards, tennis, etc. Fees from five gns. per week.
Apply, Dr. D. E. M. DOUGLAS MORRIS. *Telephone*: Newport, Pagnell 121.

THE COPPICE, NOTTINGHAM.

HOSPITAL FOR MENTAL DISEASES.

This Institution is exclusively for the reception of a limited number of Private Patients of both sexes of the Upper and Middle Classes at moderate rates of payment. It is beautifully situated in its own grounds on an eminence a short distance from Nottingham, and from its singularly healthy position and comfortable arrangements affords every facility for the relief and cure of those mentally afflicted. Voluntary and Temporary Patients received.

Tel. 54117. *For terms, etc., apply to the Medical Superintendent.*

County of London.

The LONDON COUNTY COUNCIL invites applications for appointment as DEPUTY MEDICAL SUPERINTENDENT at the MAUDSLEY HOSPITAL, Denmark Hill, S.E.5 (for treatment of *Incipient Mental Disorder*). Candidates, who must not be more than 40 years of age (unless already in the Council's Mental Hospital Service), must be registered to practise both in Medicine and Surgery in England. Appointment pensionable under the Asylums Officers Superannuation Act, 1909. Salary £850 a year, rising by annual increments of £50 to £950 a year. Charges made for board, lodging, etc. (at present £2 9s. weekly), if required to be resident. Application form (which gives full particulars) obtainable from Chief Officer (Ref. D.M.S.) L.C.C. Mental Hospital Dept., Artillery House, Artillery Row, S.W.1. Canvassing disqualifies. Applications must be received by October 3rd.

MONTAGU H. COX,
Clerk of the London County Council.

County of London.

The LONDON COUNTY COUNCIL invites applications for appointment as ASSISTANT MEDICAL OFFICER in the Mental Hospital Service. Candidates must be under 35 years of age. They must be registered to practise both in Medicine and Surgery in England, must have of at least one year's professional standing, and must have held a residential position in a General Hospital for six months, or have had comparable general experience. Salary £475 a year, rising to £550 a year (additional allowance of £50 a year to holders of D.P.M.). Emoluments. Charge for board, lodging, etc. (at present £2 9s. a week) if required to be resident. Pensionable under Asylums Officers Superannuation Act, 1909. Application form, giving full particulars, obtainable from Chief Officer (Ref. B), L.C.C. Mental Hospitals Dept., Artillery House, Artillery Row, S.W.1. Applications must be received by October 3rd. Canvassing disqualifies.

MONTAGU H. COX,
Clerk of the London County Council.

City of Liverpool.

RESIDENT ASSISTANT MEDICAL OFFICER.

Applications are invited for the appointment of Resident Assistant Medical Officer at the SMITHDOWN ROAD HOSPITAL (1,100 beds), Liverpool, for a period of one year. Salary at the rate of £200 per annum, together with the usual residential allowances. All fees received in connection with the appointment to be handed over to the City Council.

The appointment will be made in accordance with the Standing Orders of the City Council and canvassing will be deemed a disqualification.

Candidates must be single, fully qualified and registered.

Applications, stating age, qualifications, etc., with copies of three recent testimonials, to be received by the undersigned not later than September 29th.

Brougham Terrace, WALTER MOON,
Liverpool. Town Clerk.
September 15th, 1931.

Macclesfield General Infirmary. (100 Beds.)

Wanted, SECOND HOUSE SURGEON. Salary £150 per annum, with board and residence.

Candidates must be legally qualified and have had experience in the administration of Anæsthetics. Appointment for six months.

Applications, stating qualifications and enclosing copies of three testimonials, should be sent to the undersigned.

A. E. HANRAHAN, *Secretary.*

Scarborough Hospital and DISPENSARY. (70 Beds)

Wanted, November 1st, Two HOUSE SURGEONS (male or female). Duties include Out-Visiting. Salary £175 per annum, with board, residence, etc. Appointment for six months.

Applications, stating age, with copies of testimonials and essential particulars, to be sent to the undersigned by September 26th, from whom further particulars may be obtained.

J. DOUGLAS MUNBY, *Hon. Secretary.*

Aberdeen Royal Mental Hospital.

The office of SECOND ASSISTANT PHYSICIAN in the Aberdeen Royal Mental Hospital is vacant, and applications for it are invited. Previous Mental Hospital experience essential.

Salary will commence at £400 per annum, with board, rooms, and laundry.

Applications, stating age, and *full particulars* of experience, with copies of testimonials, should be sent to the Physician Superintendent.

Advertising Helps the Reader

Readers of the Journal are presented week by week with a comprehensive summary of products necessary to the medical man both in his professional and private life. The advertisement pages of the Journal are carefully scrutinised before going to press, in order that our readers may deal confidently with those firms whose announcements win their interest and attention.

Modern advertising seeks to increase demand, thereby stimulating production and building a circle of prosperity, which ultimately reacts to the advantage of the purchaser himself. Advertised products necessarily maintain a high standard of excellence, for disaster must naturally come *speedily to the manufacturer who* through any cause and at any time loses the confidence of his customers.

It is the policy of the Journal to convince advertisers that doctors prefer to be approached directly through the pages of their own publication, for in this way we believe manufacturers are encouraged to consider the special needs of the profession, and to state clearly the results of their efforts to meet these requirements when seeking orders from medical men.

The "small" advertisements section provides a *forum* for the "*domestic*" *business of the profession*, and those wishing to arrange the Sale or Purchase of Practices, requiring Assistants or Assistancies, and Partners or Partnerships, may in these pages reach thousands of their fellow medical men at very economical cost. Such transactions may, in addition, be protected by the secrecy which the free Box Number service provides.

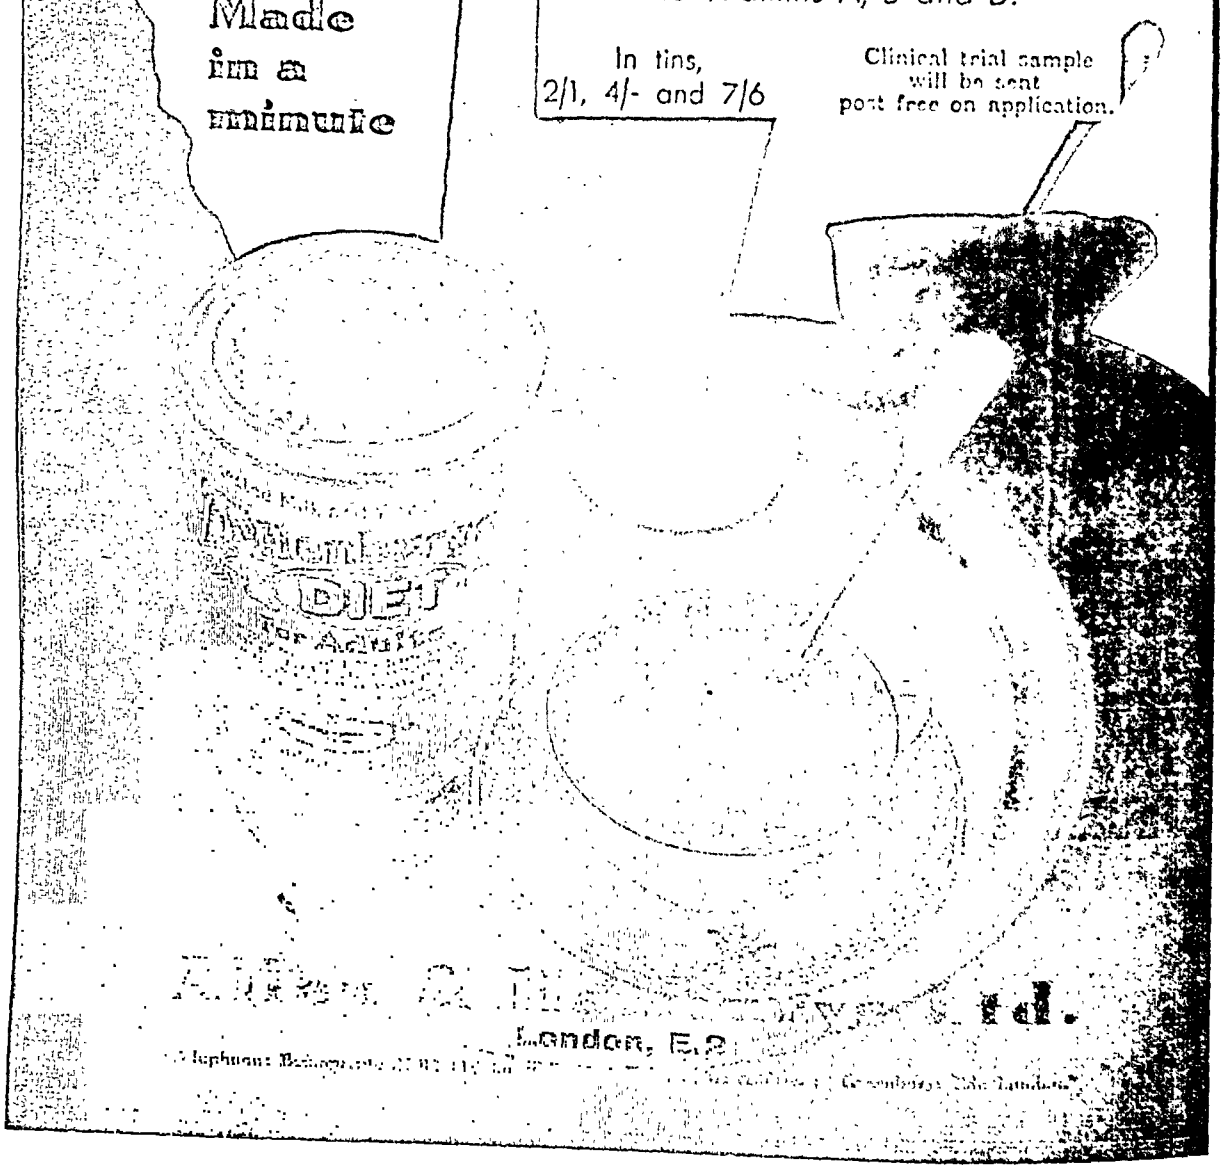
In Convalescence



When the digestive powers are weak or impaired the 'Allenburys' Diet is pre-eminently suitable as a basis of feeding during the period of recuperation. Entirely distinct from the 'Allenburys' Foods for Infants, the Diet is made from pure, rich, full-cream milk and whole wheat, partially predigested during manufacture. It contains an adequate proportion of the Vitamins A, B and D.

Made in a minute

In tins, 2/1, 4/- and 7/6

Clinical trial sample will be sent post free on application.

London, E.2

Printed and published by the British Medical Association, at their Office, Tavistock Square, in the Parish of St. Pancras, in the County of London.

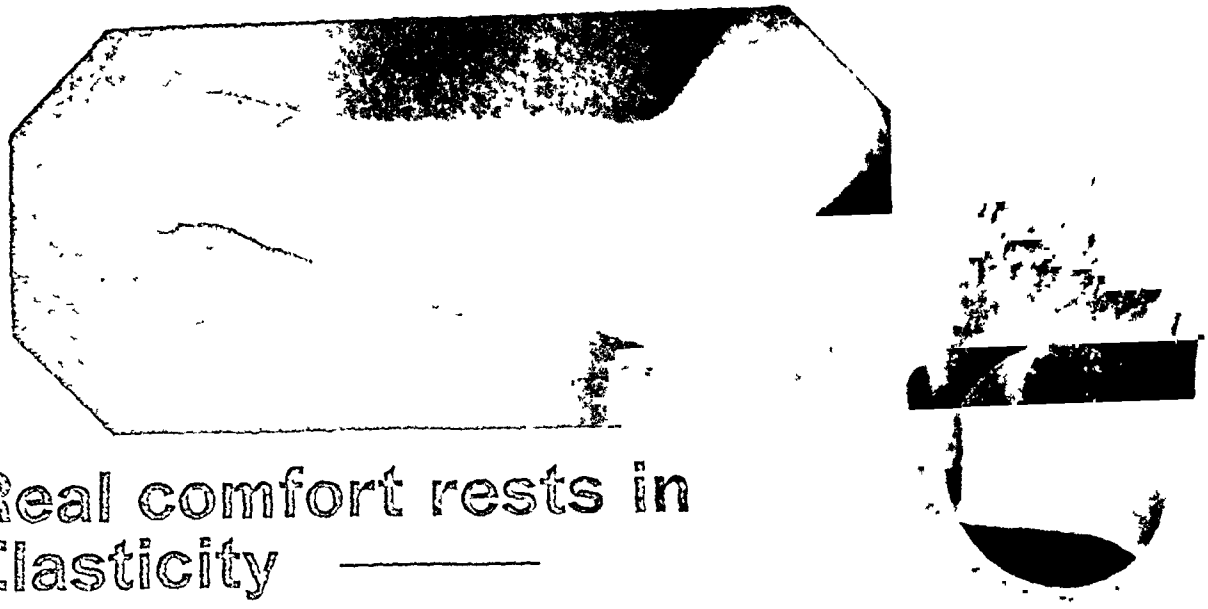
FELAMINE BRAND SANDOZ

SANDOZ

An association of the most powerful cholagogue—pure crystallised cholic acid—and the classical biliary disinfectant—hexamine, entirely free from accessory substances.



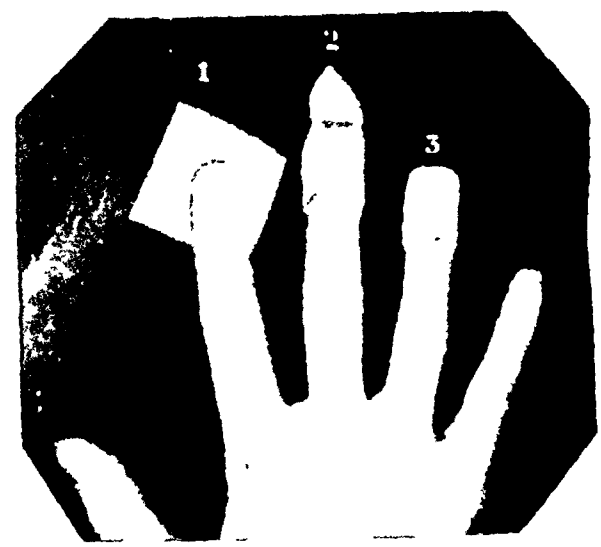
Indications:

CHOLANGITIS, CHOLECYSTITIS, HEPATIC INSUFFICIENCY, HEPATIC CONGESTION, JAUNDICE, CHRONIC CONSTIPATION.

Felamine is supplied in Bottles of 50 and 250 Tablets.

AGENCY:-
SANDOZ CHEMICAL WORKS PHARMACEUTICAL DEPT.
5, WIGMORE STREET, LONDON. W 1.

ISSUED WEEKLY] [COPYRIGHT] [REGISTERED AS A NEWSPAPER



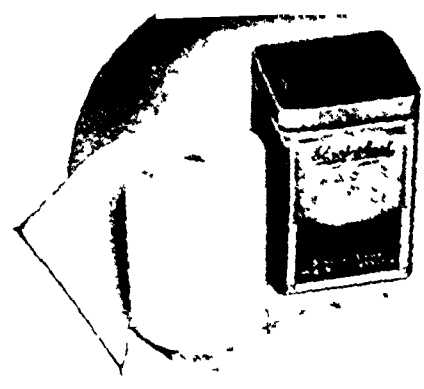
Real comfort rests in Elasticity

ELASTOPLAST DRESSINGS

combine the elastic plaster with antiseptic pads of gauze and lint. Instantly applied, they mould readily to the shape, are ventilated, pliable, neat, and healing. They need not be removed when washing, and can be left in situ until the wound is healed—or examined at intervals if necessary.

Elastoplast dispenses with ordinary bandaging—will save you much valuable time, and reduce your dressing accounts.

ELASTOPLAST BANDAGES



already the proved cure for Varicose Ulcer, are also ideal for compression and support in cases of Varicose Veins, Sprains, Strains, Dislocations, after treatment of fractures, and for all Surgical and Orthopaedic work.

Elastoplast is the only elastic plaster bandage possessing the correct degree of elasticity to ensure perfect compression and support.

Elastoplast

Patent No 253 527.

BRITISH MADE.

Literature and cuttings will be sent on application, or a trial set containing full Bandages and a range of Dressings upon receipt of P.O. value 2/6 (Overseas postage extra) by the manufacturers:

T. J. SMITH & NEPHEW, Ltd.

HULL. LONDON. GLASGOW. MANCHESTER.

A MANUAL OF GENERAL MEDICAL PRACTICE

By W. STANLEY SYKES, M.A., M.B., B.Ch. (Cantab.), D.P.H.(Leeds.) M.R.C.S. Late House Surgeon and Extern Midwifery Assistant, St Bartholomew's Hospital; Matthews Duncan Prize, 1919, St. Bartholomew's Hospital, Anaesthetist to the General Infirmary, Leeds, etc.

Extract from review of First Edition—". . . a readable and competent book. It contains a variety of information of practical value, well arranged . . . should be really informing to the young practitioner. . . . the information has been shrewdly selected with an eye upon practical purposes. This is an interesting and useful little manual written from the general practitioner's point of view, and laying stress on what the author calls 'non-hospital diseases.' It should find many readers."—LANCET.

EIGHTH EDITION. With 91 Illustrations in the Text and 2 Plates. Demy 8vo. 21s. net, postage 9d.

HYGIENE AND PUBLIC HEALTH (PARKES AND KENWOOD).

Revised by HENRY R. KENWOOD, C.M.G., M.B., F.R.S.Edin., D.P.H.Lond., Emeritus Professor of Hygiene and Public Health in the University of London, etc., and HAROLD KERR, O.B.E., M.A.Dunelm., M.D.Edin., D.P.H.Camb., Professor of Hygiene and Public Health in the University of Durham, etc.

". . . a quarry of concise information valuable to students and practical workers, a bargain at the price asked for it."—BRIT. MED. JOURN.

Beaumont's FUNDAMENTAL PRINCIPLES OF RAY THERAPY: An Elementary Textbook for Nurses, Students, and Practitioners.

By WILLIAM BEAUMONT, M.R.C.S. Foreword by Sir W. HALE WHITE, K.B.E., M.D., F.R.C.P. With 35 Illustrations. Crown 8vo. 6s. net, postage 5d.

". . . a practical and readable little book."
—INDIAN JOURNAL OF MEDICINE GAZETTE.

Kenwood's PUBLIC HEALTH LABORATORY WORK (Chemistry).

By HENRY R. KENWOOD, C.M.G., M.B., D.P.H., F.C.S., etc. Eighth Edition. Demy 8vo. 12s. 6d. net, postage 6d. *Lewis's Practical Series*.

". . . precludes no other book on laboratory technique has had so large and appreciative an audience."—THE MEDICAL OFFICER.

Forsdike's STERILITY IN WOMEN: Diagnosis and Treatment.

By S. FORSDIKE, M.D., B.S.Lond., F.R.C.S.Eng. and Edin. With 23 Illustrations, including 17 Plates. 9s. net, postage 5d.

". . . easy to read and follow and compels attention."
—WEST LONDON MEDICAL JOURNAL.

Mackenzie's ACTION OF MUSCLES: Including Muscle Rest and Muscle Re-Education.

By Sir COLIN MACKENZIE, M.D., F.R.C.S. *Second Edition, with 100* Illustrations. Demy 8vo. 12s. 6d. net, postage 6d.

". . . a work which should be studied and mastered by every orthopaedic surgeon."—BRITISH MEDICAL JOURNAL.

SIXTH Edition. Plates from Original Drawings (6 in Colours) and other Illus. in Text. Demy 8vo. 30s. net, post 9d.

ON DISEASES OF THE LUNGS AND PLEURAE

Including TUBERCULOSIS AND MEDIASTINAL GROWTHS.

By Sir RICHARD DOUGLAS POWELL, Bt., K.C.V.O., M.D.Lond., F.R.C.P., late Physician-in-Ordinary to H.M. the King; Consulting Physician to the Middlesex and Brompton Hospitals, and Sir PERCIVAL H.-S. HARTLEY, C.V.O., M.D.Camb., F.R.C.P., Physician, St. Bart's Hospital, Senior Physician, Brompton Consumption Hospital, etc.

". . . can be confidently recommended as a safe guide to the practitioner in search of authoritative medical opinion."—BRIT. MED. JOURN.

RECENTLY PUBLISHED. ENTIRELY RE-WRITTEN Pp. xvi + 562.
With 49 Coloured Illustrations on 20 Plates and 123 Figures in the Text. Demy 8vo. 35s. net; postage 1s.

DISEASES OF THE TONGUE

Being the third edition of Butlin's "Diseases of the Tongue."

By W. G. SPENCER, M.S., F.R.C.S., Consulting Surgeon, Westminster Hospital; and STANFORD CADE, F.R.C.S., Assist. Surg., Westminster Hospital, Surgeon, Mount Vernon Hospital, etc.

"The directions for detailed treatment are lucid and sufficiently dogmatic . . . must prove of the high st value. . . . An admirable book."—B.M.J.

JUST PUBLISHED. THIRD EDITION. With many Tables. Bound in Flexible Leather, Marbled edges. Imp. 8vo. 30s. net; postage 1s. (inland), 2s. (abroad).

Senior Physician to the National Hospital for Diseases of the Heart, Consulting Physician to the Royal Northern Hospital, London.
Demy 8vo Pp. 551 With 249 text figures, including 32 sphygmograms, 9 polygraph tracings, and 17 electrocardiograms

NEW SECOND EDITION, 21s. net.

"By great care and by the use of an amazing amount of material, he has accomplished what many readers have been waiting for, giving us a complete account of the diagnosis, prognosis, and treatment of heart diseases by modern methods in association with all the invaluable teaching bequeathed to us by the older masters of clinical observations."—LANCET

"The most valuable and comprehensive guide to the study of Cardiology with which we are acquainted."—NEW YORK MEDICAL JOURNAL AND RECORD

"We think that most of our readers engaged in general practice will find this work extremely useful."—THE JOURNAL OF CLINICAL RESEARCH

"In our opinion this book is indisputably the most authoritative contribution to cardiology of our time."—FRANCO-BRITISH MEDICAL REVIEW.

"A book which we believe is destined to remain the standard work on Cardiology for many years to come."—AMERICAN MEDICINE

"The second edition of this popular work on heart disease bears evidence of thorough revision, while the essentially clinical standpoint of the work is maintained."—EDINBURGH MEDICAL JOURNAL.

"It may be said at once that the book admirably fulfils the purpose it has in view, and is a practically useful, lucid, and reliable guide."—NEWCASTLE MEDICAL JOURNAL.

"Well-written, concise, and complete, containing a wealth of practical information. Obviously based upon the author's own extensive and investigative work."—SURGERY, GYNECOLOGY, AND OBSTETRICS (Official Journal of the American College of Surgeons)

"Dr. Price is to be congratulated again on the appearance in its second edition of his distinguished contribution to this increasingly important subject of Cardiology."—THE CANADIAN JOURNAL OF MEDICINE AND SURGERY

OXFORD UNIVERSITY PRESS, Amen House, Warwick Square, London, E.C.4.

The DIGESTIBILITY of LACTOGEN

The special Lactogen emulsifying process breaks up the large fat globules of the raw milk into a very finely-divided and widely-dispersed form. This promotes quicker digestive action. The curd is also broken down, and made fine and flaky, so that it approximates breast milk and is exceedingly digestible.

FREE SAMPLES A full detailed descriptive literature will be sent to any Member of the Medical Profession upon request. Lactogen Bureau (Dept. Z 34), Nestlé and Anglo-Swiss Condensed Milk Co., 6 & 8, Lastchaff, London, E.C.3

AUTHORITIES ENDORSE ALUMINIUM FOR HEALTHY COOKING

The world-wide use of aluminium ware reveals a growing appreciation of the metal for its hygienic, economic, and labour-saving qualities. Parallel with public approval is the ready endorsement of aluminium by British and American medical authorities, the German Board of Health, and other recognised experts.

② AMERICAN

In 1926 a most exhaustive investigation was conducted by the John Crerar Library of Chicago, generally conceded to have the most complete and authentic collection of medical data in the country. Mr. Robert J. Fisher, Reference Librarian, who conducted the investigation, reported: "All medical and chemical sources have been examined. As a result it may be stated that there is no authentic record to be found in print that anyone has suffered ill-health, much less poisoning, from Aluminium salt contained in food products cooked in Aluminium utensils."

D. Tourtellotte and O. S. Rask, working at the School of Hygiene and Public Health, Johns Hopkins University, and using a highly perfected experimental technique, conclude (January and July, 1931) that Aluminium compounds are not toxic or detrimental to any biological function in concentrations up to 600 parts per million, and that they are not appreciably absorbed out of the intestinal tract.

A *résumé* of published evidence by British, American and Continental medical authorities, will be sent gratis on request.

IN all cases where woollen underwear is not only needful but absolutely vital, Wolsey is the wisest suggestion to make. For Wolsey underwear is made of purest wool and offers all the blessings of health and comfort that only pure wool provides. It is soft and warm and, above all, hygienically right. Scientific investigations* have proved that garments made of wool do more than any other to prevent the deposition of moisture on the skin; retain warmth better than any other material, and thus allow the most equable body temperature possible.

*By the British Research Association for the Woollen and Worsted Industries, details of reports of which will be sent free on application to Wolsey Ltd., Leicester.

When reliability is VITAL!

instal an Ediswan

The product of 25 years of specialised experience plus the finest British materials and workmanship.

All the surgeon's skill and the nurses' care might be set at nought if the lights should fail at the crucial moment. Guard against this risk by installing an Ediswan Stationary Battery, to keep your lights going in the event of current failure. These batteries cost little to run, little to instal and they last for years. We can design one exactly to suit your needs.

The Ideal Laxative

REGULOL REGD.

IT is a highly palatable Emulsion of Liquid Paraffin with Agar-Agar, possessing all the advantages of the former without its objectionable qualities, and forming probably the best possible remedy for Chronic Constipation in Children and Adults.

"Regulol" is available in two forms: "PLAIN" or "COMPOUND." The latter is a combination with Phenolphthalein 1 grains per oz., and is indicated in more acute forms of Constipation where the simple lubricating effect of Paraffin is insufficient.

SAMPLE 1-lb. JAR FREE ON REQUEST.

Please indicate whether Plain or Compound is required

(This offer is limited to the British Isles.)
